LECTURE 2 Aug 24^{th}, 2023

PART I Fundamental Concepts in Quantum Information

This Lecture Understanding and Measuring one qubit

- Qubits and QM Law 1 (Superposition)
- Measurements and QM Law 2 (Born's Rule)
  - standard
  - in a different basis
- Uncertainty Principle
- Global vs Relative Phase

QM Law 1

RECALL Qubit quantum state in superposition of two basic states "$|0\rangle$" and "$|1\rangle$"

"α amplitude on $|0\rangle$, β amplitude on $|1\rangle$"
where α, β are complex numbers satisfying $|\alpha|^2 + |\beta|^2 = 1$ $\quad \begin{pmatrix} \alpha \\ \beta \end{pmatrix} \in \mathbb{C}^2$

E.g. a photon may have the state "$\frac{1}{\sqrt{2}}$ amplitude on $|0\rangle$, $\frac{1}{\sqrt{2}}$ amplitude on $|1\rangle$"

OR

Is this a quantum state? ← "$\frac{i}{\sqrt{2}}$ amplitude on $|0\rangle$, 0 amplitude on $|1\rangle$"

OR

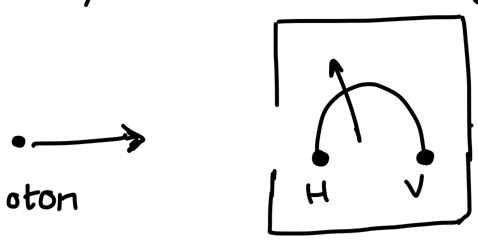
"$\underbrace{\text{1 amplitude on } |0\rangle, \text{ 0 amplitude on } |1\rangle}$"

called "$|0\rangle$"

reverse "$|1\rangle$"

You cannot read a quantum state, i.e., access α, β directly
Only way to extract information is via measurement

What happens if a photon in a superposition state goes into the measuring device?



photon

α ampl. "$|0\rangle$"

β ampl. "$|1\rangle$"

This scenario is described by the second law of quantum mechanics

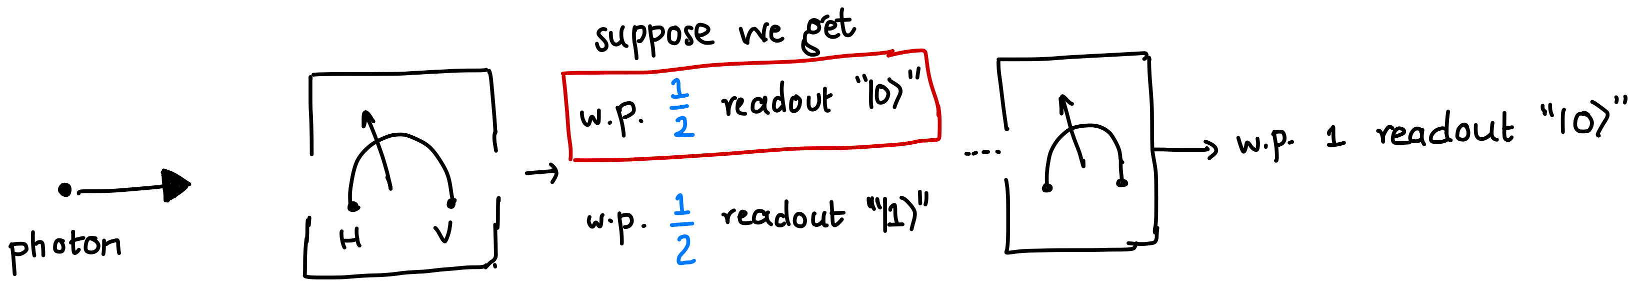
QM Law 2 (Born's Rule) For a particle with α amplitude on $|0\rangle$, β amplitude on $|1\rangle$ if you measure it, then

w/ prob $|\alpha|^2$, readout shows "$|0\rangle$" AND state becomes "1 amplitude on $|0\rangle$"
w/ prob $|\beta|^2$, readout shows "$|1\rangle$" state becomes "$\underbrace{\text{1 amplitude on } |1\rangle}_{\text{whatever outcome was observed}}$"

E.g. photon in state "$\frac{4}{5}$ amplitude on $|0\rangle$, $\frac{3}{5}$ amplitude on $|1\rangle$"

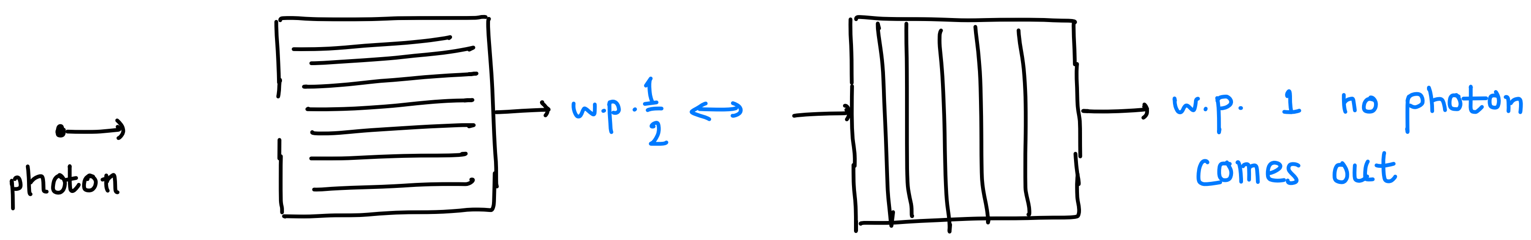
w.p. 0.64, readout shows $|0\rangle$
w.p 0.36, readout shows $|1\rangle$

Example



$\frac{1}{\sqrt{2}}$ amplitude on $|0\rangle$
$\frac{1}{\sqrt{2}}$ amplitude on $|1\rangle$

Example (Filter)



$\frac{1}{\sqrt{2}}$ amplitude on $|0\rangle$
$\frac{1}{\sqrt{2}}$ amplitude on $|1\rangle$

Measure $\leftrightarrow$ or $\updownarrow$
Let $\leftrightarrow$ photons pass
Block $\updownarrow$ photons

To describe Born's rule more generally, we first take a detour and introduce quantum notation

Recall a qubit in state "α ampl. on "$|0\rangle$", β ampl. on "$|1\rangle$" " can be described as a column vector

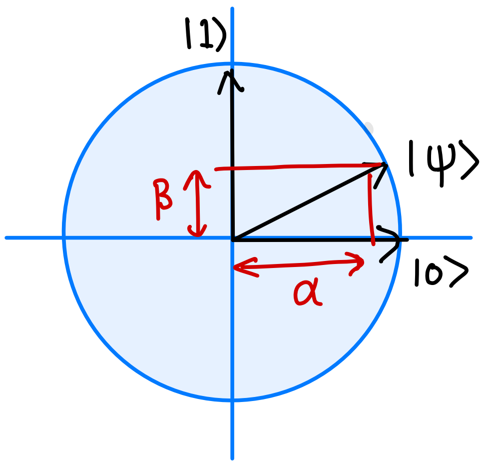
$$\begin{pmatrix} \alpha \\ \beta \end{pmatrix} \in \mathbb{C}^2 \quad \text{s.t. } |\alpha|^2 + |\beta|^2 = 1$$

It is also a <u>unit vector</u>

If we only use real amplitudes α, β

length of $\nearrow (\alpha, \beta)$

$= \sqrt{\alpha^2 + \beta^2} = 1$



"$|0\rangle$" = 1 ampl. on "$|0\rangle$" $\quad = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$
0 ampl. on "$|1\rangle$"

"$|1\rangle$" = reverse $\quad = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$

$\{|0\rangle, |1\rangle\}$ forms an orthonormal basis for $\mathbb{R}^2$

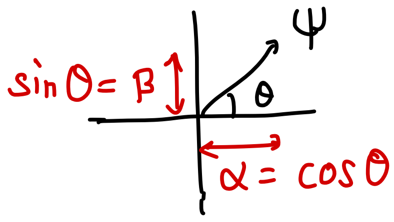
Any qubit can be written as $\alpha|0\rangle + \beta|1\rangle$ where $|\alpha|^2 + |\beta|^2 = 1$

Let $\quad \alpha \begin{pmatrix} 1 \\ 0 \end{pmatrix} + \beta \begin{pmatrix} 0 \\ 1 \end{pmatrix} = \begin{pmatrix} \alpha \\ \beta \end{pmatrix} =$ "ψ" = unit vector

How can we describe α, β in terms of ψ ?

α = "Projection of "ψ" on $|0\rangle$" = $\langle$"ψ", "$|0\rangle$"$\rangle$

β = "Projection of "ψ" on $|1\rangle$" = $\langle$"ψ", "$|1\rangle$"$\rangle$



If $u, v \in \mathbb{R}^n$, then

$\langle u, v \rangle$ = Inner product of u and v $= \sum_{i=1}^{n} u_i v_i = (u_1 \cdots u_n) \begin{pmatrix} v_1 \\ \vdots \\ v_n \end{pmatrix} = u^T v$

$\|u\|$ = length of u $= \sqrt{\langle u, u \rangle} = \sqrt{\sum_{i=1}^{n} u_i^2}$ $\leftarrow$ if "ψ" $= \begin{pmatrix} \alpha \\ \beta \end{pmatrix}$

$\|\psi\| = \sqrt{\alpha^2 + \beta^2}$

What happens with complex vectors $u, v \in \mathbb{C}^n$?

$\langle u, v \rangle = \sum_{i=1}^{n} \overline{u_i} v_i = (\overline{u_1} \cdots \overline{u_n}) \begin{pmatrix} v_1 \\ \vdots \\ v_n \end{pmatrix} = u^\dagger v$ $\longrightarrow$ dagger or conjugate transpose of u

$\|u\|$ = length $= \sqrt{\langle u, u \rangle} = \sqrt{\sum_{i=1}^{n} \overline{u_i} u_i} = \sqrt{\sum |u_i|^2}$

So, if "ψ" $= \begin{pmatrix} \alpha \\ \beta \end{pmatrix} \in \mathbb{C}^2$, then $\|\psi\| = \sqrt{|\alpha|^2 + |\beta|^2}$

Also, $\{|0\rangle, |1\rangle\}$ is an orthonormal basis for $\mathbb{C}^2$

so, $\alpha = \langle$"ψ", "$|0\rangle$"$\rangle$ and $\beta = \langle$"ψ", "$|1\rangle$"$\rangle$

Dirac's Bra-Ket Notation

- $|\psi\rangle =$ column vector e.g. $|0\rangle = \begin{pmatrix}1\\0\end{pmatrix}$ and $|1\rangle = \begin{pmatrix}0\\1\end{pmatrix}$

  $|\cdot\rangle$ is called a ket

- $\langle\psi| = \underbrace{\text{conjugate transpose of } \psi}_{\psi^{\dagger}\ \text{row vector}} = (\bar{\psi}_1 \ \cdots \ \bar{\psi}_n)$

  $\langle\cdot|$ is called a bra

- Inner Product of $|\psi\rangle, |\sigma\rangle$

  $$= (\bar{\psi}_1 \ \cdots \ \bar{\psi}_n)\begin{pmatrix}\sigma_1\\ \vdots \\ \sigma_n\end{pmatrix} = \langle\psi|\cdot|\sigma\rangle = \langle\psi|\sigma\rangle$$

Given a qubit $|\psi\rangle$ and orthonormal basis $\{|0\rangle, |1\rangle\}$

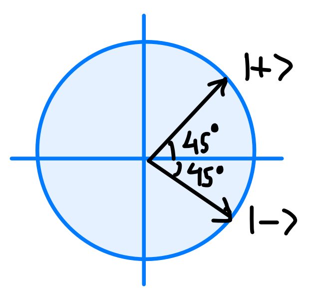
$$|\psi\rangle = \underbrace{\langle 0|\psi\rangle}_{\text{scalar}} |0\rangle + \underbrace{\langle 1|\psi\rangle}_{\text{scalar}} |1\rangle$$

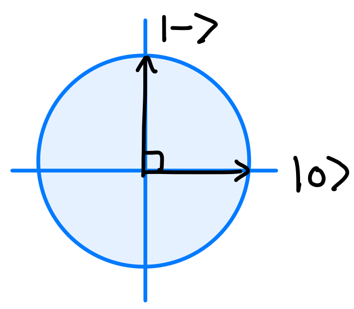
Can do the same for any basis $\{|b_0\rangle, |b_1\rangle\}$

$$|\psi\rangle = \langle b_0|\psi\rangle |b_0\rangle + \langle b_1|\psi\rangle |b_1\rangle$$

Example

$$\begin{pmatrix}1/\sqrt{2}\\1/\sqrt{2}\end{pmatrix} = \frac{1}{\sqrt{2}}|0\rangle + \frac{1}{\sqrt{2}}|1\rangle = \text{"}|+\rangle\text{"}$$





$$\begin{pmatrix}1/\sqrt{2}\\-1/\sqrt{2}\end{pmatrix} = \frac{1}{\sqrt{2}}|0\rangle - \frac{1}{\sqrt{2}}|1\rangle = \text{"}|-\rangle\text{"}$$

$$|0\rangle = \underbrace{\frac{1}{\sqrt{2}}}\,|+\rangle + \underbrace{\frac{1}{\sqrt{2}}}\,|-\rangle$$

$$|1\rangle = \underbrace{\frac{1}{\sqrt{2}}}\,|+\rangle - \underbrace{\frac{1}{\sqrt{2}}}\,|-\rangle$$

Exercise How do you express $\langle\psi|$ in terms of ket notation?
