ECE 220 Computer Systems & Programming

Lecture 26 – Course Review Day 1 December 4, 2025

- Extra credit quiz is available on PrairieLearn until 12/10
- Programming competition 7pm on 12/10 (location TBA)

Programming Concepts & Data Structure from the Bottom-up

```
Part 1: LC-3

    Assembly language programming & process

    O Memory-mapped I/O: input from keyboard, output to monitor
    O TRAPS & Subroutines, Interrupts & Exceptions
    Stacks
Part 2: C

    Built-in data types, operators, scope

    o Functions & run-time stack
    o Pointers & arrays

    Recursion: searching, sorting, backtracking

    O I/O: streams and buffers, read from / write to file

    User-defined data types: enum, struct, union

    Dynamic memory allocation

    Linked data structures: linked list (stack, queue) & trees

Part 3: C++

    Class (encapsulation, inheritance, abstraction)

    o Pass by value /(const) reference / address

    Virtual function, operator overload, template (polymorphism)
```

Part 1: LC-3 Review

- Address space: 2¹⁶ locations, addressability: 16 bits
- General-purpose registers: R0, R1, ... R7
- Special-purpose register: PC, IR
- Input from keyboard: KBDR/KBSR
- Output to monitor: DDR/DSR
- Operate instructions: ADD, AND, NOT
- Data movement instructions: LD, LDI, LDR, LEA, ST, STR, STI
- Control instructions: BR, JSR/JSRR, JMP, RET, TRAP, RTI
- Condition codes: N (negative), Z (zero), P (positive)
- TRAPs: In, GETC, OUT, PUTS (uses R0; R7 is modified after call)
- Subroutines: callee-save vs. caller-save, nested subroutine needs to save R7
- Interrupts: external event, supervisor vs. user stack, RTI instruction
- Exceptions: internal event for handling errors
- Stack: FILO, overflow, underflow, R6 (stack ptr), R5 (frame ptr)

Part 2: C Review

- Scope: local vs. global variables (determined by location of declaration)
- Storage class: static (retains value, global data area) vs. automatic (stack)
- Control structures: conditionals (if, if-else, switch); loops (for, while, do-while)
- Functions & run-time stack (C to LC-3)
- Pointer: address of a variable in memory
- Array: a list of values arranged sequentially in memory
- Pass by value vs. pass by reference (pointer)
- Pointer Array **Duality** (int array[10] = {1,2,3,4,5,6,7,8,9}; int *ptr = array;)
- Recursion: base case(s) and recursive case(s)
- File I/O: fopen, fclose, fscanf, fprintf
- Linked lists & trees (pointer, struct, dynamic memory allocation)

Part 3: C++ Review

- Class vs. Struct: 4 features of OOP
- Dynamic memory allocation/deallocation: new, delete
- Basic I/O: std, cin, cout
- Pass by value vs. pass by address vs. pass by (const) reference
- Operator and function overloading
- Base class & derived Class: access identifier (public, protected, private)
- Virtual function and virtual function table: static vs. dynamic binding
- Function and class templates: separate type with container
- Big three: copy ctor (deep vs. shallow copy), dtor, copy assignment operator
- Implicit 'this' pointer: a pointer to the invoking object
- Vectors: dynamic arrays, elements are stored in consecutive locations
- Lists: doubly linked lists, elements are allocated individually
- Iterators: mechanism used to minimize an algorithm's dependency on data structure on which it operates
