Connectivity

## Connectivity

Given a graph $G=(\boldsymbol{V}, \boldsymbol{E})$ :
(1) path: sequence of distinct vertices $v_{1}, v_{2}, \ldots, v_{k}$ such that $v_{i} v_{i+1} \in E$ for $1 \leq i \leq k-1$. The length of the path is $k-1$ (the number of edges in the path) and the path is from $\boldsymbol{v}_{1}$ to $\boldsymbol{v}_{\boldsymbol{k}}$. Note: a single vertex $\boldsymbol{u}$ is a path of length 0 . cycle: sequence of distinct vertices $v_{1}, v_{2}, \ldots, v_{k}$ such that $\left\{v_{i}, v_{i+1}\right\} \in E$ for
$1<i \leq k-1$ and $\left\{v_{1}, v_{k}\right\} \in E$. Single vertex not a cycle according to this definition.
Caveat: Some times people use the term cycle to also allow vertices to be repeated; we will use the term tour
(3) A vertex $\boldsymbol{u}$ is connected to $\boldsymbol{v}$ if there is a path from $\boldsymbol{u}$ to $\boldsymbol{v}$
a The connected component of $\boldsymbol{u}, \operatorname{con}(u)$, is the set of all vertices connected to $u$ Is $u \in \operatorname{con}(u)$ ?

## Connectivity

Given a graph $G=(V, E)$ :
(1) path: sequence of distinct vertices $v_{1}, v_{2}, \ldots, v_{k}$ such that $v_{i} v_{i+1} \in E$ for $1 \leq i \leq k-1$. The length of the path is $k-1$ (the number of edges in the path) and the path is from $\boldsymbol{v}_{1}$ to $\boldsymbol{v}_{\boldsymbol{k}}$. Note: a single vertex $\boldsymbol{u}$ is a path of length 0 .
(2) cycle: sequence of distinct vertices $v_{1}, v_{2}, \ldots, v_{k}$ such that $\left\{v_{i}, v_{i+1}\right\} \in E$ for $1 \leq i \leq k-1$ and $\left\{v_{1}, v_{k}\right\} \in E$. Single vertex not a cycle according to this definition.
Caveat: Some times people use the term cycle to also allow vertices to be repeated; we will use the term tour.
© A vertex $u$ is connected to $v$ if there is a path from $u$ to $v$.

- The connected component of $u, \operatorname{con}(\boldsymbol{u})$, is the set of all vertices connected to $u$. Is $u \in \operatorname{con}(u)$ ?

## Connectivity

Given a graph $G=(V, E)$ :
(1) path: sequence of distinct vertices $v_{1}, v_{2}, \ldots, v_{k}$ such that $v_{i} v_{i+1} \in E$ for $1 \leq i \leq k-1$. The length of the path is $k-1$ (the number of edges in the path) and the path is from $\boldsymbol{v}_{1}$ to $\boldsymbol{v}_{\boldsymbol{k}}$. Note: a single vertex $\boldsymbol{u}$ is a path of length 0 .
(2) cycle: sequence of distinct vertices $v_{1}, v_{2}, \ldots, v_{k}$ such that $\left\{v_{i}, v_{i+1}\right\} \in E$ for $1 \leq i \leq k-1$ and $\left\{v_{1}, v_{k}\right\} \in E$. Single vertex not a cycle according to this definition.
Caveat: Some times people use the term cycle to also allow vertices to be repeated; we will use the term tour.
(3) A vertex $\boldsymbol{u}$ is connected to $\boldsymbol{v}$ if there is a path from $\boldsymbol{u}$ to $\boldsymbol{v}$.

- The connected component of $u, \operatorname{con}(u)$, is the set of all vertices connected to $u$ Is $u \in \operatorname{con}(u)$ ?

## Connectivity

Given a graph $G=(V, E)$ :
(1) path: sequence of distinct vertices $v_{1}, v_{2}, \ldots, v_{k}$ such that $v_{i} v_{i+1} \in E$ for $1 \leq i \leq k-1$. The length of the path is $k-1$ (the number of edges in the path) and the path is from $\boldsymbol{v}_{1}$ to $\boldsymbol{v}_{\boldsymbol{k}}$. Note: a single vertex $\boldsymbol{u}$ is a path of length 0 .
(2) cycle: sequence of distinct vertices $v_{1}, v_{2}, \ldots, v_{k}$ such that $\left\{v_{i}, v_{i+1}\right\} \in E$ for $1 \leq i \leq k-1$ and $\left\{v_{1}, v_{k}\right\} \in E$. Single vertex not a cycle according to this definition.
Caveat: Some times people use the term cycle to also allow vertices to be repeated; we will use the term tour.
(0) A vertex $\boldsymbol{u}$ is connected to $\boldsymbol{v}$ if there is a path from $\boldsymbol{u}$ to $\boldsymbol{v}$.
( - The connected component of $\boldsymbol{u}, \operatorname{con}(\boldsymbol{u})$, is the set of all vertices connected to $\boldsymbol{u}$. Is $\boldsymbol{u} \in \operatorname{con}(\boldsymbol{u})$ ?

## Connectivity contd

Define a relation $C$ on $\boldsymbol{V} \times \boldsymbol{V}$ as $\boldsymbol{u} C \boldsymbol{v}$ if $\boldsymbol{u}$ is connected to $v$
(1) In undirected graphs, connectivity is a reflexive, symmetric, and transitive relation. Connected components are the equivalence classes.
(2) Graph is connected if there is only one
 connected component.

## Connectivity Problems

## Algorithmic Problems

(1) Given graph $G$ and nodes $u$ and $v$, is $u$ connected to $v$ ?
(2) Given $\boldsymbol{G}$ and node $\boldsymbol{u}$, find all nodes that are connected to $\boldsymbol{u}$.
© Find all connected components of $G$.

```
Can be accomplished in O(m+n) time using BFS or DFS
BFS and DFS are refinements of a basic search procedure which is good to understand
on its own.
```

## Connectivity Problems

## Algorithmic Problems

(1) Given graph $\boldsymbol{G}$ and nodes $\boldsymbol{u}$ and $\boldsymbol{v}$, is $\boldsymbol{u}$ connected to $\boldsymbol{v}$ ?
(2) Given $\boldsymbol{G}$ and node $\boldsymbol{u}$, find all nodes that are connected to $\boldsymbol{u}$.
( Find all connected components of $G$.

Can be accomplished in $\boldsymbol{O}(\boldsymbol{m}+\boldsymbol{n})$ time using BFS or DFS.
BFS and DFS are refinements of a basic search procedure which is good to understand on its own.

## THE END

(for now)
