Graph exploration in directed graphs

## Basic Graph Search in Directed Graphs

## Given $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{E})$ a directed graph and vertex $\boldsymbol{u} \in \boldsymbol{V}$. Let $\boldsymbol{n}=|\boldsymbol{V}|$.

```
Explore(G,u):
    array Visited[1..n]
```

```
    List: ToExplore, S
    Add u}\mathrm{ to ToExplore and to S, Visited [u]}\leftarrowTRU
    Make tree T with root as u
    while (ToExplore is non-empty) do
        Remove node x from ToExplore
        for each edge (x,y) in Adj(x) do
        if (Visited[y] = FALSE)
            Visited[y]}\leftarrow TRU
            Add y to ToExplore
            Add y to S
            Add y to }\boldsymbol{T}\mathrm{ with edge (x,y)
    Output S
```

## Properties of Basic Search

## Proposition

Explore $(G, u)$ terminates with $S=\operatorname{rch}(\boldsymbol{u})$.

## Proof Sketch.

- Once Visited[i] is set to TRUE it never changes. Hence a node is added only once to ToExplore. Thus algorithm terminates in at most $\boldsymbol{n}$ iterations of while loop.
- By induction on iterations, can show $v \in S \Rightarrow v \in \operatorname{rch}(u)$
- Since each node $v \in S$ was in ToExplore and was explored, no edges in $G$ leave $\boldsymbol{S}$. Hence no node in $\boldsymbol{V}-\boldsymbol{S}$ is in $\operatorname{rch}(\boldsymbol{u})$. Caveat: In directed graphs edges can enter $S$.
- Thus $S=\operatorname{rch}(\boldsymbol{u})$ at termination.

## Properties of Basic Search

## Proposition <br> Explore $(\boldsymbol{G}, \boldsymbol{u})$ terminates in $\mathbf{O}(\boldsymbol{m}+\boldsymbol{n})$ time.

## Proposition

$\boldsymbol{T}$ is a search tree rooted at $\boldsymbol{u}$ containing $S$ with edges directed away from root to leaves.

Proof: easy exercises
BFS and DFS are special case of Basic Search.
(1) Breadth First Search (BFS): use queue data structure to implementing the list ToExplore
(2) Depth First Search (DFS): use stack data structure to implement the list ToExplore

## Exercise

Prove the following:

## Proposition

Let $S=\operatorname{rch}(u)$. There is no edge $(x, y) \in E$ where $x \in S$ and $y \notin S$.
Describe an example where $\operatorname{rch}(\boldsymbol{u}) \neq \boldsymbol{V}$ and there are edges from $\boldsymbol{V} \backslash \boldsymbol{r c h}(\boldsymbol{u})$ to $\operatorname{rch}(u)$.

## Directed Graph Connectivity Problems

(1) Given $G$ and nodes $\boldsymbol{u}$ and $\boldsymbol{v}$, can $\boldsymbol{u}$ reach $\boldsymbol{v}$ ?
(2) Given $G$ and $\boldsymbol{u}$, compute $\operatorname{rch}(\boldsymbol{u})$.
(0) Given $G$ and $\boldsymbol{u}$, compute all $\boldsymbol{v}$ that can reach $\boldsymbol{u}$, that is all $\boldsymbol{v}$ such that $u \in \operatorname{rch}(v)$.
(0) Find the strongly connected component containing node $\boldsymbol{u}$, that is $\operatorname{SCC}(\boldsymbol{u})$.

- Is $G$ strongly connected (a single strong component)?
- Compute all strongly connected components of $G$.
$\square$
First five problems can be solved in $O(n+m)$ time by via Basic Search (or BFS/DFS). The last one can also be done in linear time but requires a rather clever DFS based algorithm.
