## Single-Source Shortest Paths with Negative Edge Lengths

## Problem statement

## Single-Source Shortest Path

## Problems

Input: A directed graph $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{E})$ with arbitrary (including negative) edge lengths. For edge $\boldsymbol{e}=(\boldsymbol{u}, \boldsymbol{v})$, $\ell(\boldsymbol{e})=\ell(\boldsymbol{u}, \boldsymbol{v})$ is its length.
(1) Given nodes $\boldsymbol{s}, \boldsymbol{t}$ find shortest path from $s$ to $t$.
(2) Given node $s$ find shortest path from $\boldsymbol{s}$ to all other nodes.

## What are the distances computed by Dijkstra's algorithm?

The distance as computed by Dijkstra algorithm starting from $s$ :
(A) $s=0, x=5, y=1, z=0$.
(B) $s=0, x=1, y=2, z=5$.
(c) $s=0, x=5, y=1, z=2$.
(D) IDK.

False assumption: Dijkstra's algorithm is based on the assumption that if $\boldsymbol{s}=\boldsymbol{v}_{\mathbf{0}} \rightarrow \boldsymbol{v}_{\mathbf{1}} \rightarrow \boldsymbol{v}_{\mathbf{2}} \ldots \rightarrow \boldsymbol{v}_{\boldsymbol{k}}$ is a shortest path from $\boldsymbol{s}$ to $\boldsymbol{v}_{\boldsymbol{k}}$ then $\boldsymbol{\operatorname { d i s t }}\left(\boldsymbol{s}, \boldsymbol{v}_{\boldsymbol{i}}\right) \leq \boldsymbol{\operatorname { d i s t }}\left(\boldsymbol{s}, \boldsymbol{v}_{\boldsymbol{i}+\boldsymbol{1}}\right)$ for $\mathbf{0} \leq \boldsymbol{i}<\boldsymbol{k}$. Holds true only for non-negative edge lengths.

(2) False: $\operatorname{dist}\left(s, v_{i}\right) \leq \operatorname{dist}\left(s, v_{k}\right)$ for $1 \leq i<k$. Holds true only for non-negative Cannot explore nodes in increasing order of distance! We need other strategies.
