19.4

Scheduling to Minimize Lateness

## Scheduling to Minimize Lateness

(1) Given jobs $J_{1}, J_{2}, \ldots, J_{n}$ with deadlines and processing times to be scheduled on a single resource.
(2) If a job $i$ starts at time $s_{i}$ then it will finish at time $f_{i}=s_{i}+\boldsymbol{t}_{\boldsymbol{i}}$, where $\boldsymbol{t}_{\boldsymbol{i}}$ is its processing time. $\boldsymbol{d}_{i}$ : deadline.
(3) The lateness of a job is $\boldsymbol{\ell}_{\boldsymbol{i}}=\max \left(0, \boldsymbol{f}_{\boldsymbol{i}}-\boldsymbol{d}_{\boldsymbol{i}}\right)$.
(1) Schedule all jobs such that $L=\max \boldsymbol{\ell}_{\boldsymbol{i}}$ is minimized.

(3) The lateness of a job is $\boldsymbol{\ell}_{\boldsymbol{i}}=\max \left(0, \boldsymbol{f}_{\boldsymbol{i}}-\boldsymbol{d}_{\boldsymbol{i}}\right)$.
(1) Schedule all jobs such that $L=\max \boldsymbol{\ell}_{\boldsymbol{i}}$ is minimized.

|  | $\boldsymbol{J}_{1}$ | $\boldsymbol{J}_{2}$ | $\boldsymbol{J}_{3}$ | $\boldsymbol{J}_{4}$ | $\boldsymbol{J}_{5}$ | $\boldsymbol{J}_{6}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{t}_{\boldsymbol{i}}$ | 3 | 2 | 1 | 4 | 3 | 2 |
| $\boldsymbol{d}_{\boldsymbol{i}}$ | 6 | 8 | 9 | 9 | 14 | 15 |

## Greedy Template

```
Initially \(\boldsymbol{R}\) is the set of all requests
curr_time \(=0\)
\(\boldsymbol{m a x}\) _lateness \(=0\)
while \(R\) is not empty do
    choose \(i \in R\)
    curr_time \(=\) curr_time \(+t_{i}\)
    if (curr_time \(>\boldsymbol{d}_{\boldsymbol{i}}\) ) then
        max_lateness \(=\max \left(\right.\) curr_time \(-\boldsymbol{d}_{\boldsymbol{i}}\), max_lateness \()\)
return max_lateness
```

Main task: Decide the order in which to process jobs in $R$

## Greedy Template

```

return max_lateness
```

Main task: Decide the order in which to process jobs in $R$

## Three Algorithms

(1) Shortest job first - sort according to $\boldsymbol{t}_{\boldsymbol{i}}$.
(2) Shortest slack first - sort according to $\boldsymbol{d}_{\boldsymbol{i}}-\boldsymbol{t}_{\boldsymbol{i}}$.
(3) $\mathrm{EDF}=$ Earliest deadline first - sort according to $\boldsymbol{d}_{\boldsymbol{i}}$.

## Three Algorithms

(1) Shortest job first - sort according to $\boldsymbol{t}_{\boldsymbol{i}}$.
(2) Shortest slack first - sort according to $\boldsymbol{d}_{\boldsymbol{i}}-\boldsymbol{t}_{\boldsymbol{i}}$.
(3) $\mathrm{EDF}=$ Earliest deadline first - sort according to $\boldsymbol{d}_{\boldsymbol{i}}$.

Counter examples for first two: exercise

## Earliest Deadline First

## Theorem 19.1.

Greedy with EDF rule minimizes maximum lateness.
Proof via an exchange argument.

Idle time: time during which machine is not working
Lemma 19.2.
If there is a feasible schedule then there is one with no idle time before all jobs are finished.

## Earliest Deadline First

## Theorem 19.1.

Greedy with EDF rule minimizes maximum lateness.
Proof via an exchange argument.

```
Idle time: time during which machine is not working
LEm\ma 19.2
If there is a feasible schedule then there is one with no idle time before all jobs are
finished
```

## Earliest Deadline First

Theorem 19.1.
Greedy with EDF rule minimizes maximum lateness.
Proof via an exchange argument.

Idle time: time during which machine is not working.
Lemma 19.2.
If there is a feasible schedule then there is one with no idle time before all jobs are finished.

## Earliest Deadline First

## Theorem 19.1.

Greedy with EDF rule minimizes maximum lateness.
Proof via an exchange argument.
Idle time: time during which machine is not working.
Lemma 19.2.
If there is a feasible schedule then there is one with no idle time before all jobs are finished.

## Inversions

EDF $=$ Earliest Deadline First
Assume jobs are sorted such that $\boldsymbol{d}_{1} \leq \boldsymbol{d}_{2} \leq \ldots \leq \boldsymbol{d}_{\boldsymbol{n}}$. Hence EDF schedules them in this order.

## Definition 19.3.

A schedule $S$ is said to have an inversion if there are jobs $i$ and $j$ such that $S$ schedules $i$ before $j$, but $\boldsymbol{d}_{\boldsymbol{i}}>\boldsymbol{d}_{\boldsymbol{j}}$.

## Claim 19.4 <br> If a schedule $S$ has an inversion then there is an inversion between two adjacent scheduled jobs.

## Inversions

## EDF $=$ Earliest Deadline First

Assume jobs are sorted such that $\boldsymbol{d}_{1} \leq \boldsymbol{d}_{2} \leq \ldots \leq \boldsymbol{d}_{\boldsymbol{n}}$. Hence EDF schedules them in this order.

## Definition 19.3.

A schedule $S$ is said to have an inversion if there are jobs $i$ and $j$ such that $S$ schedules $\boldsymbol{i}$ before $\boldsymbol{j}$, but $\boldsymbol{d}_{\boldsymbol{i}}>\boldsymbol{d}_{\boldsymbol{j}}$.

## Claim 19.4.

If a schedule $S$ has an inversion then there is an inversion between two adjacent scheduled jobs.

Proof: exercise.

## Proof sketch of Optimality of EDF

- Let $S$ be an optimum schedule with smallest number of inversions.
- If $S$ has no inversions then this is same as EDF and we are done.
- Else $\boldsymbol{S}$ has two adjacent jobs $\boldsymbol{i}$ and $\boldsymbol{j}$ with $\boldsymbol{d}_{\boldsymbol{i}}>\boldsymbol{d}_{\boldsymbol{j}}$.
- Swap positions of $i$ and $j$ to obtain a new schedule $S^{\prime}$

## Claim 19.5.

Maximum lateness of $S^{\prime}$ is no more than that of $S$. And $S^{\prime}$ has strictly fewer inversions than $S$.

## THE END

(for now)
