The reduction: Encoding the formula constraints

## 3SAT $\leq_{p}$ Directed Hamiltonian Cycle

Input: $\varphi$ formula.
Output: Graph $\boldsymbol{G}_{\varphi}$.

Saw: How to encode assignments... Now need to encode constraints of $\varphi$.

## The reduction algorithm: Phase I

## Converting $\varphi$ to a graph

- Traverse path $\boldsymbol{i}$ from left to right iff $\boldsymbol{x}_{\boldsymbol{i}}$ is set to true
- Each path has $\mathbf{3}(\boldsymbol{m}+\mathbf{1})$ nodes where $\boldsymbol{m}$ is number of clauses in $\varphi$; nodes numbered from left to right ( 1 to $3 m+3$ )

## The Reduction algorithm: Phase II

- Add vertex $\boldsymbol{c}_{\boldsymbol{j}}$ for clause $\boldsymbol{C}_{\boldsymbol{j}} . \boldsymbol{c}_{\boldsymbol{j}}$ has edge from vertex $\mathbf{3} \boldsymbol{j}$ and to vertex $\mathbf{3} \boldsymbol{j}+\mathbf{1}$ on path $\boldsymbol{i}$ if $\boldsymbol{x}_{\boldsymbol{i}}$ appears in clause $\boldsymbol{C}_{\boldsymbol{j}}$, and has edge from vertex $\mathbf{3} \boldsymbol{j}+\mathbf{1}$ and to vertex $\mathbf{3} \boldsymbol{j}$ if $\neg \boldsymbol{x}_{\boldsymbol{i}}$ appears in $\boldsymbol{C}_{\boldsymbol{j}}$.

$$
x_{1} \vee \neg x_{2} \vee x_{4} \quad \neg x_{1} \vee \neg x_{2} \vee \neg x_{3}
$$
