## CS/ECE 374: Algorithms \& Models of Computation

## Intractability and Reductions

Lecture 19
April 15, 2021

## Course Outline

- Part I: models of computation (reg exps, DFA/NFA, CFGs, TMs)
- Part II: (efficient) algorithm design
- Part III: intractability via reductions
- Undecidablity: problems that have no algorithms
- NP-Completeness: problems unlikely to have efficient algorithms unless $\boldsymbol{P}=\boldsymbol{N P}$

## Part I

## Intractability and Lower Bounds

## Turing Machines and Church-Turing Thesis

Turing defined TMs as a machine model of computation
Church-Turing thesis: any function that is computable can be computed by TMs

Efficient Church-Turing thesis: any function that is computable can be computed by TMs with only a polynomial slow-down

## Computability and Complexity Theory

- What functions can and cannot be computed by TMs?
- What functions/problems can and cannot be solved efficiently?

## Why?

- Foundational questions about computation
- Pragmatic: Can we solve our problem or not?
- Are we not being clever enough to find an efficient algorithm or should we stop because there isn't one or likely to be one?

## Lower Bounds and Impossibility Results

Prove that given problem cannot be solved (efficiently) on a TM. Informally we say that the problem is "hard".

Generally quite difficult: algorithms can be very non-trivial and clever.

Example: The famous $P \neq N P$ conjecture.

## Reductions to Prove Intractability

A general methodology to prove impossibility results.

- Start with some known hard problem $X$
- Reduce $\boldsymbol{X}$ to your favorite problem $\boldsymbol{Y}$

If $Y$ can be solved then so can $X \Rightarrow Y$ is also hard

## Reductions to Prove Intractability

A general methodology to prove impossibility results.

- Start with some known hard problem $\boldsymbol{X}$
- Reduce $X$ to your favorite problem $Y$

If $Y$ can be solved then so can $X \Rightarrow Y$ is also hard

Caveat: In algorithms we reduce new problem to known solved one!

## Reductions to Prove Intractability

A general methodology to prove impossibility results.

- Start with some known hard problem $\boldsymbol{X}$
- Reduce $X$ to your favorite problem $Y$

If $Y$ can be solved then so can $X \Rightarrow Y$ is also hard
Caveat: In algorithms we reduce new problem to known solved one!
Who gives us the initial hard problem?

- Some clever person (Cantor/Gödel/Turing/Cook/Levin ...) who establish hardness of a fundamental problem
- Assume some core problem is hard because we haven't been able to solve it for a long time. This leads to conditional results

## Reductions to Prove Intractability

A general methodology to prove impossibility results.

- Start with some known hard problem $\boldsymbol{X}$
- Reduce $X$ to your favorite problem $Y$

If $Y$ can be solved then so can $X \Rightarrow Y$ is also hard
Caveat: In algorithms we reduce new problem to known solved one!
Who gives us the initial hard problem?

- Some clever person (Cantor/Gödel/Turing/Cook/Levin ...) who establish hardness of a fundamental problem
- Assume some core problem is hard because we haven't been able to solve it for a long time. This leads to conditional results

Reduction is a powerful and unifying tool in Computer Science

## Decision Problems, Languages, Terminology

When proving hardness we limit attention to decision problems

- A decision problem $\Pi$ is a collection of instances (strings)
- For each instance $I$ of $\Pi$, answer is YES or NO
- Equivalently: boolean function $f_{\Pi}: \Sigma^{*} \rightarrow\{0,1\}$ where $f(\boldsymbol{I})=1$ if $\boldsymbol{I}$ is a YES instance, $f(I)=0$ if NO instance
- Equivalently: language $L_{\Pi}=\{I \mid I$ is a YES instance $\}$

## Decision Problems, Languages, Terminology

When proving hardness we limit attention to decision problems

- A decision problem $\Pi$ is a collection of instances (strings)
- For each instance $I$ of $\Pi$, answer is YES or NO
- Equivalently: boolean function $f_{\Pi}: \Sigma^{*} \rightarrow\{0,1\}$ where $\boldsymbol{f}(\boldsymbol{I})=1$ if $\boldsymbol{I}$ is a YES instance, $\boldsymbol{f}(\boldsymbol{I})=0$ if NO instance
- Equivalently: language $L_{\Pi}=\{I \mid I$ is a YES instance $\}$

Notation about encoding: distinguish I from encoding $\langle I\rangle$

- $\boldsymbol{n}$ is an integer. $\langle\boldsymbol{n}\rangle$ is the encoding of $\boldsymbol{n}$ in some format (could be unary, binary, decimal etc)
- $G$ is a graph. $\langle G\rangle$ is the encoding of $G$ in some format
- $M$ is a TM. $\langle M\rangle$ is the encoding of TM as a string according to some fixed convention

## Examples

- Given directed graph $G$, is it strongly connected? $\langle G\rangle$ is a YES instance if it is, otherwise NO instance
- Given number $\boldsymbol{n}$, is it a prime number? $L_{\text {PRIMES }}=\{\langle\boldsymbol{n}\rangle \mid \boldsymbol{n}$ is prime $\}$
- Given number $\boldsymbol{n}$ is it a composite number?
$L_{\text {COMPOSITE }}=\{\langle\boldsymbol{n}\rangle \mid \boldsymbol{n}$ is a composite $\}$
- Given $G=(\boldsymbol{V}, \boldsymbol{E}), s, t, B$ is the shortest path distance from $s$ to $t$ at most $B$ ? Instance is $\langle G, s, t, B\rangle$

## Part II

## (Polynomial Time) Reductions

## Reductions for decision problems/languages

For languages $L_{X}, L_{Y}$, a reduction from $L_{X}$ to $L_{Y}$ is:
(1) An algorithm...
(2) Input: $w \in \Sigma^{*}$
(3) Output: $w^{\prime} \in \Sigma^{*}$
(4) Such that:

$$
w \in L_{Y} \Longleftrightarrow w^{\prime} \in L_{X}
$$

## Reductions for decision problems/languages

For languages $L_{X}, L_{Y}$, a reduction from $L_{X}$ to $L_{Y}$ is:
(1) An algorithm...
(2) Input: $w \in \Sigma^{*}$
(3) Output: $w^{\prime} \in \Sigma^{*}$
(4) Such that:

$$
w \in L_{Y} \Longleftrightarrow w^{\prime} \in L_{X}
$$

(Actually, this is only one type of reduction, but this is the one we will use for hardness.) There are other kinds of reductions.

## Reductions for decision problems/languages

For decision problems $X, Y$, a reduction from $X$ to $Y$ is:
(1) An algorithm ...
(2) Input: $\boldsymbol{I}_{\boldsymbol{X}}$, an instance of $\boldsymbol{X}$.
(3) Output: $I_{Y}$ an instance of $Y$.
(1) Such that: $\boldsymbol{I}_{\boldsymbol{Y}}$ is YES instance of $\boldsymbol{Y} \Longleftrightarrow \boldsymbol{I}_{\boldsymbol{X}}$ is YES instance of $\boldsymbol{X}$

## Reductions

(1) $\mathcal{R}$ : Reduction $X \rightarrow Y$
(2) $\mathcal{A}_{Y}$ : algorithm for $Y$ :
(3) $\Rightarrow$ New algorithm for $\boldsymbol{X}$ :

$$
\begin{aligned}
\mathcal{A}_{X}\left(I_{X}\right): & \\
& / / I_{X}: \text { instance of } X . \\
& I_{Y} \Leftarrow \mathcal{R}\left(I_{X}\right) \\
& \text { return } \mathcal{A}_{Y}\left(I_{Y}\right)
\end{aligned}
$$

## Reductions

(1) $\mathcal{R}$ : Reduction $X \rightarrow Y$
(2) $\mathcal{A}_{\boldsymbol{Y}}$ : algorithm for $Y$ :
(0) $\Longrightarrow$ New algorithm for $\boldsymbol{X}$ :

$$
\begin{aligned}
\mathcal{A}_{X}\left(I_{X}\right): & / / I_{X}: \text { instance of } X . \\
& I_{Y} \Leftarrow \mathcal{R}\left(I_{X}\right) \\
& \text { return } \mathcal{A}_{Y}\left(I_{Y}\right)
\end{aligned}
$$

If $\mathcal{R}$ and $\mathcal{A}_{\boldsymbol{Y}}$ polynomial-time $\Longrightarrow \mathcal{A}_{\boldsymbol{X}}$ polynomial-time.

## Reductions and running time

$\boldsymbol{R}(\boldsymbol{n})$ : running time of $\mathcal{R}$
$Q(\boldsymbol{n})$ : running time of $\mathcal{A}_{\boldsymbol{r}}$
Question: What is running time of $\mathcal{A}_{\boldsymbol{x}}$ ?

## Reductions and running time

$\boldsymbol{R}(\boldsymbol{n})$ : running time of $\mathcal{R}$
$Q(\boldsymbol{n})$ : running time of $\mathcal{A}_{\boldsymbol{Y}}$
Question: What is running time of $\mathcal{A}_{\boldsymbol{x}} \boldsymbol{?} \boldsymbol{O}(R(n)+Q(R(n))$. Why?

- If $\boldsymbol{I}_{\boldsymbol{X}}$ has size $\boldsymbol{n}, \mathcal{R}$ creates an instance $\boldsymbol{I}_{\boldsymbol{Y}}$ of size at most $\boldsymbol{R}(\boldsymbol{n})$
- $\mathcal{A}_{Y}$ 's time on $I_{Y}$ is by definition at most $Q\left(\left|I_{Y}\right|\right) \leq Q(R(n))$.

Example: If $R(n)=n^{2}$ and $Q(n)=n^{1.5}$ then $\mathcal{A}_{\boldsymbol{X}}$ is $O\left(n^{3}\right)$

## Notation and Implication of Reductions

(1) If Problem $X$ reduces to Problem $Y$ we write $X \leq Y$
(2) If Problem $\boldsymbol{X}$ reduces to Problem $\boldsymbol{Y}$ where reduction $\boldsymbol{\mathcal { R }}$ is an efficient (polynomial-time algorithm) we write $X \leq_{P} Y$.

## Notation and Implication of Reductions

(1) If Problem $X$ reduces to Problem $Y$ we write $X \leq Y$
(2) If Problem $\boldsymbol{X}$ reduces to Problem $\boldsymbol{Y}$ where reduction $\mathcal{R}$ is an efficient (polynomial-time algorithm) we write $X \leq_{P} Y$.

Algorithmic implication:

## Lemma

- If $\boldsymbol{X} \leq \boldsymbol{Y}$ and $\boldsymbol{Y}$ has an algorithm then $\boldsymbol{X}$ has an algorithm.
- If $\boldsymbol{X} \leq_{P} Y$ and $\boldsymbol{Y}$ has a polynomial-time algorithm then $\boldsymbol{X}$ has a polynomial-time algorithm.

## Hardness Implications of Reductions

(1) Problem $X$ reduces to Problem $Y: X \leq Y$
(2) Problem $\boldsymbol{X}$ efficiently reduces to Problem $\boldsymbol{Y}: X \leq_{P} \boldsymbol{Y}$.

## Hardness implication:

## Lemma

- If $\boldsymbol{X} \leq \boldsymbol{Y}$ and $\boldsymbol{X}$ does not have an algorithm then $\boldsymbol{Y}$ does not have an algorithm.
- If $X \leq_{P} Y$ and $X$ does not have a polynomial-time algorithm then $Y$ does not have a polynomial-time algorithm.

## Hardness Implications of Reductions

(1) Problem $X$ reduces to Problem $Y: X \leq Y$
(2) Problem $X$ efficiently reduces to Problem $Y: X \leq_{P} Y$.

## Hardness implication:

## Lemma

- If $\boldsymbol{X} \leq \boldsymbol{Y}$ and $\boldsymbol{X}$ does not have an algorithm then $\boldsymbol{Y}$ does not have an algorithm.
- If $X \leq_{p} Y$ and $X$ does not have a polynomial-time algorithm then $Y$ does not have a polynomial-time algorithm.

## Proof.

Suppose $Y$ has an algorithm. Then $X$ does too since $X \leq Y$. But contradicts assumption that $\boldsymbol{X}$ does not have an algorithm. Similarly for efficient reduction.

## Transitivity of Reductions

```
Proposition
\(\boldsymbol{X} \leq \boldsymbol{Y}\) and \(\boldsymbol{Y} \leq \boldsymbol{Z}\) implies that \(\boldsymbol{X} \leq \boldsymbol{Z}\). Similarly \(\boldsymbol{X} \leq_{P} \boldsymbol{Y}\) and \(\boldsymbol{Y} \leq_{P} \boldsymbol{Z}\) implies \(\boldsymbol{X} \leq_{p} \boldsymbol{Z}\).
```

Note: $\boldsymbol{X} \leq \boldsymbol{Y}$ does not imply that $\boldsymbol{Y} \leq \boldsymbol{X}$ and hence it is very important to know the FROM and TO in a reduction.

## Proving Correctness of Reductions

To prove that $X \leq Y$ you need to give an algorithm $\mathcal{A}$ that:
(1) Transforms an instance $\boldsymbol{I}_{\boldsymbol{X}}$ of $\boldsymbol{X}$ into an instance $\boldsymbol{I}_{\boldsymbol{Y}}$ of $\boldsymbol{Y}$.
(2) Satisfies the property that answer to $I_{X}$ is YES iff $I_{Y}$ is YES.
(1) typical easy direction to prove: answer to $I_{Y}$ is YES if answer to $I_{X}$ is YES
(2) typical difficult direction to prove: answer to $\boldsymbol{I}_{\boldsymbol{X}}$ is YES if answer to $\boldsymbol{I}_{\boldsymbol{Y}}$ is YES (equivalently answer to $\boldsymbol{I}_{\boldsymbol{X}}$ is NO if answer to $I_{Y}$ is NO).
(3) To prove $X \leq_{P} Y$, additionally show that $\mathcal{A}$ runs in polynomial time.

## Remember, remember, remember

- Algorithm design: reduce new problem $\boldsymbol{X}$ to known easy problem $Y$
- Hardness: reduce known hard problem $\boldsymbol{X}$ to new problem $\boldsymbol{Y}$

Tools to remember:

- Am I trying to design algorithm or prove hardness?
- What do I know about some standard problems? Easy or hard?

## Part III

## Examples of Reductions

## Independent Sets and Cliques

Given a graph $G$, a set of vertices $V^{\prime}$ is:

## Independent Sets and Cliques

Given a graph $G$, a set of vertices $V^{\prime}$ is:
(1) independent set: no two vertices of $\boldsymbol{V}^{\prime}$ connected by an edge.

## Independent Sets and Cliques

Given a graph $G$, a set of vertices $V^{\prime}$ is:
(1) independent set: no two vertices of $V^{\prime}$ connected by an edge.
(2) clique: every pair of vertices in $V^{\prime}$ is connected by an edge of G

## Independent Sets and Cliques

Given a graph $G$, a set of vertices $V^{\prime}$ is:
(1) independent set: no two vertices of $V^{\prime}$ connected by an edge.
(2) clique: every pair of vertices in $V^{\prime}$ is connected by an edge of G .

## Independent Sets and Cliques

Given a graph $G$, a set of vertices $V^{\prime}$ is:
(1) independent set: no two vertices of $V^{\prime}$ connected by an edge.
(2) clique: every pair of vertices in $V^{\prime}$ is connected by an edge of G .

## Independent Sets and Cliques

Given a graph $G$, a set of vertices $V^{\prime}$ is:
(1) independent set: no two vertices of $V^{\prime}$ connected by an edge.
(2) clique: every pair of vertices in $V^{\prime}$ is connected by an edge of G .

## The Independent Set and Clique Problems

Problem: Independent Set
Instance: A graph G and an integer $k$.
Question: Does $G$ has an independent set of size $\geq \boldsymbol{k}$ ?

## The Independent Set and Clique Problems

Problem: Independent Set
Instance: A graph G and an integer $\boldsymbol{k}$.
Question: Does $G$ has an independent set of size $\geq \boldsymbol{k}$ ?

## Problem: Clique

Instance: A graph G and an integer $k$.
Question: Does $G$ has a clique of size $\geq k$ ?

## Reducing Independent Set to Clique

An instance of Independent Set is a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$.

## Reducing Independent Set to Clique

An instance of Independent Set is a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$.

## Reducing Independent Set to Clique

An instance of Independent Set is a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$.
Reduction given $\langle\boldsymbol{G}, \boldsymbol{k}\rangle$ outputs $\langle\overline{\boldsymbol{G}}, \boldsymbol{k}\rangle$ where $\overline{\boldsymbol{G}}$ is the complement of $\boldsymbol{G} . \overline{\boldsymbol{G}}$ has an edge $(\boldsymbol{u}, \boldsymbol{v})$ if and only if $(\boldsymbol{u}, \boldsymbol{v})$ is not an edge of $\boldsymbol{G}$.

## Reducing Independent Set to Clique

An instance of Independent Set is a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$.
Reduction given $\langle\boldsymbol{G}, \boldsymbol{k}\rangle$ outputs $\langle\overline{\boldsymbol{G}}, \boldsymbol{k}\rangle$ where $\overline{\boldsymbol{G}}$ is the complement of $\boldsymbol{G} . \overline{\boldsymbol{G}}$ has an edge $(\boldsymbol{u}, \boldsymbol{v})$ if and only if $(\boldsymbol{u}, \boldsymbol{v})$ is not an edge of $\boldsymbol{G}$.

## Reducing Independent Set to Clique

An instance of Independent Set is a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$.
Reduction given $\langle\boldsymbol{G}, \boldsymbol{k}\rangle$ outputs $\langle\overline{\boldsymbol{G}}, \boldsymbol{k}\rangle$ where $\overline{\boldsymbol{G}}$ is the complement of $\boldsymbol{G} . \overline{\boldsymbol{G}}$ has an edge $(\boldsymbol{u}, \boldsymbol{v})$ if and only if $(\boldsymbol{u}, \boldsymbol{v})$ is not an edge of $\boldsymbol{G}$.

## Reducing Independent Set to Clique

An instance of Independent Set is a graph $\boldsymbol{G}$ and an integer $\boldsymbol{k}$.
Reduction given $\langle\boldsymbol{G}, \boldsymbol{k}\rangle$ outputs $\langle\overline{\boldsymbol{G}}, \boldsymbol{k}\rangle$ where $\overline{\boldsymbol{G}}$ is the complement of $\boldsymbol{G} . \overline{\boldsymbol{G}}$ has an edge $(\boldsymbol{u}, \boldsymbol{v})$ if and only if $(\boldsymbol{u}, \boldsymbol{v})$ is not an edge of $\boldsymbol{G}$.

## Correctness of reduction

## Lemma

$G$ has an independent set of size $k$ if and only if $\bar{G}$ has a clique of size $k$.

## Proof.

Need to prove two facts:
$\boldsymbol{G}$ has independent set of size at least $\boldsymbol{k}$ implies that $\overline{\boldsymbol{G}}$ has a clique of size at least $k$.
$\bar{G}$ has a clique of size at least $\boldsymbol{k}$ implies that $\boldsymbol{G}$ has an independent set of size at least $k$.
Easy to see both from the fact that $S \subseteq V$ is an independent set in $G$ if and only if $S$ is a clique in $\overline{\boldsymbol{G}}$.

## Independent Set and Clique

Independent Set $\leq_{P}$ Clique. What does this mean?

## Independent Set and Clique

Independent Set $\leq_{P}$ Clique. What does this mean?
(1) If have an algorithm for Clique, then we have an algorithm for Independent Set.
(2) The reduction is efficient. Hence, if we have a poly-time algorithm for Clique, then we have a poly-time algorithm for Independent Set.
(3) Clique is at least as hard as Independent Set.

## Independent Set and Clique

Independent Set $\leq_{P}$ Clique. What does this mean?
(1) If have an algorithm for Clique, then we have an algorithm for Independent Set.
(2) The reduction is efficient. Hence, if we have a poly-time algorithm for Clique, then we have a poly-time algorithm for Independent Set.
(3) Clique is at least as hard as Independent Set.

Also... Clique $\leq_{P}$ Independent Set. Why?

## Independent Set and Clique

Independent Set $\leq_{P}$ Clique. What does this mean?
(1) If have an algorithm for Clique, then we have an algorithm for Independent Set.
(2) The reduction is efficient. Hence, if we have a poly-time algorithm for Clique, then we have a poly-time algorithm for Independent Set.
(3) Clique is at least as hard as Independent Set.

Also... Clique $\leq_{P}$ Independent Set. Why?
Caveat: in general $\boldsymbol{X} \leq \boldsymbol{Y}$ does not mean that $\boldsymbol{Y} \leq \boldsymbol{X}$.

## Vertex Cover

Given a graph $G=(\boldsymbol{V}, \boldsymbol{E})$, a set of vertices $S$ is:

## Vertex Cover

Given a graph $G=(\boldsymbol{V}, \boldsymbol{E})$, a set of vertices $S$ is:
(1) A vertex cover if every $e \in E$ has at least one endpoint in $S$.

## Vertex Cover

Given a graph $G=(\boldsymbol{V}, \boldsymbol{E})$, a set of vertices $S$ is:
(1) A vertex cover if every $e \in E$ has at least one endpoint in $S$.

## Vertex Cover

Given a graph $G=(\boldsymbol{V}, \boldsymbol{E})$, a set of vertices $S$ is:
(1) A vertex cover if every $e \in E$ has at least one endpoint in $S$.

## Vertex Cover

Given a graph $G=(\boldsymbol{V}, \boldsymbol{E})$, a set of vertices $S$ is:
(1) A vertex cover if every $e \in E$ has at least one endpoint in $S$.

## The Vertex Cover Problem

## Problem (Vertex Cover)

Input: A graph $G$ and integer $k$.
Goal: Is there a vertex cover of size $\leq \boldsymbol{k}$ in $G$ ?

## The Vertex Cover Problem

## Problem (Vertex Cover)

Input: A graph $G$ and integer $k$.
Goal: Is there a vertex cover of size $\leq k$ in $G$ ?

Can we relate Independent Set and Vertex Cover?

## Relationship between...

## Proposition

Let $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{E})$ be a graph. $S$ is an independent set if and only if $\boldsymbol{V} \backslash \boldsymbol{S}$ is a vertex cover.

## Proof.

$(\Rightarrow)$ Let $S$ be an independent set
(1) Consider any edge $\boldsymbol{u} \boldsymbol{v} \in \boldsymbol{E}$.
(2) Since $\boldsymbol{S}$ is an independent set, either $\boldsymbol{u} \notin S$ or $\boldsymbol{v} \notin S$.
(3) Thus, either $\boldsymbol{u} \in \boldsymbol{V} \backslash \boldsymbol{S}$ or $\boldsymbol{v} \in \boldsymbol{V} \backslash \boldsymbol{S}$.
(1) $\boldsymbol{V} \backslash \boldsymbol{S}$ is a vertex cover.
$(\Leftarrow)$ Let $V \backslash S$ be some vertex cover:
(1) Consider $u, v \in S$
(2) $\boldsymbol{u v}$ is not an edge of G, as otherwise $\boldsymbol{V} \backslash \boldsymbol{S}$ does not cover $\boldsymbol{u} \boldsymbol{v}$.
(3) $\Longrightarrow S$ is thus an independent set.

## Independent Set $\leq_{P}$ Vertex Cover

(1) $\boldsymbol{G}$ : graph with $\boldsymbol{n}$ vertices, and an integer $\boldsymbol{k}$ be an instance of the Independent Set problem.
(2) Reduction: given $(\boldsymbol{G}, \boldsymbol{k})$, an instance of Independent Set, ouput ( $\boldsymbol{G}, \boldsymbol{n}-\boldsymbol{k}$ ) as an instance of Vertex Cover.
(3) $G$ has an independent set of size $\geq k$ iff $G$ has a vertex cover of size $\leq \boldsymbol{n}-\boldsymbol{k}$ which proves correctness.
(4) Easy to see reduction is efficient.
(5) Therefore, Independent Set $\leq_{p}$ Vertex Cover. Also Vertex Cover $\leq_{P}$ Independent Set.

## Part IV

## Reasoning about Programs

## DFA Accepting a String

Given DFA $M$ and string $w \in \Sigma^{*}$, does $M$ accept $w$ ?

- Instance is $\langle M, w\rangle$
- Algorithm: given $\langle M, w\rangle$, output YES if $M$ accepts $w$, else NO

Does above DFA accept 0010110?

## DFA Accepting a String

Given DFA $M$ and string $w \in \Sigma^{*}$, does $M$ accept $w$ ?

- Instance is $\langle M, w\rangle$
- Algorithm: given $\langle M, w\rangle$, output YES if $M$ accepts $w$, else NO

Question: Is there an (efficient) algorithm for this problem?

## DFA Accepting a String

Given DFA $M$ and string $w \in \Sigma^{*}$, does $M$ accept $w$ ?

- Instance is $\langle M, w\rangle$
- Algorithm: given $\langle M, w\rangle$, output YES if $M$ accepts $w$, else NO

Question: Is there an (efficient) algorithm for this problem?
Yes. Simulate $M$ on $w$ and output YES if $M$ reaches a final state.
Exercise: Show a linear time algorithm. Note that linear is in the input size which includes both encoding size of $M$ and $|w|$.

## NFA Accepting a String

Given NFA $N$ and string $w \in \Sigma^{*}$, does $N$ accept $w$ ?

- Instance is $\langle N, w\rangle$
- Algorithm: given $\langle N, w\rangle$, output YES if $N$ accepts $w$, else NO

Does above NFA accept 0010110?

## NFA Accepting a String

Given NFA $N$ and string $w \in \Sigma^{*}$, does $N$ accept $w$ ?

- Instance is $\langle N, w\rangle$
- Algorithm: given $\langle N, w\rangle$, output YES if $N$ accepts $w$, else NO

Question: Is there an algorithm for this problem?

## NFA Accepting a String

Given NFA $N$ and string $w \in \Sigma^{*}$, does $N$ accept $w$ ?

- Instance is $\langle N, w\rangle$
- Algorithm: given $\langle\boldsymbol{N}, \boldsymbol{w}\rangle$, output YES if $N$ accepts $w$, else NO

Question: Is there an algorithm for this problem?

- Convert $N$ to equivalent DFA $M$ and use previous algorithm!
- Hence a reduction that takes $\langle N, w\rangle$ to $\langle M, w\rangle$
- Is this reduction efficient?

## NFA Accepting a String

Given NFA $N$ and string $\boldsymbol{w} \in \Sigma^{*}$, does $N$ accept $\boldsymbol{w}$ ?

- Instance is $\langle N, w\rangle$
- Algorithm: given $\langle\boldsymbol{N}, \boldsymbol{w}\rangle$, output YES if $N$ accepts $w$, else NO

Question: Is there an algorithm for this problem?

- Convert $N$ to equivalent DFA $M$ and use previous algorithm!
- Hence a reduction that takes $\langle N, w\rangle$ to $\langle M, w\rangle$
- Is this reduction efficient? No, because $|M|$ is exponential in $|N|$ in the worst case.

Exercise: Describe a polynomial-time algorithm.
Hence reduction may allow you to see an easy algorithm but not necessarily best algorithm!

## DFA Universality

A DFA $M$ is universal if it accepts every string. That is, $L(M)=\Sigma^{*}$, the set of all strings.

## DFA Universality

A DFA $M$ is universal if it accepts every string.
That is, $L(M)=\Sigma^{*}$, the set of all strings.

## Problem (DFA universality)

Input: $A$ DFA $\langle M\rangle$.
Goal: Is M universal?

## DFA Universality

A DFA $M$ is universal if it accepts every string.
That is, $L(M)=\Sigma^{*}$, the set of all strings.

## Problem (DFA universality)

Input: A DFA $\langle M\rangle$.
Goal: Is M universal?
How do we solve DFA Universality?

## DFA Universality

A DFA $M$ is universal if it accepts every string.
That is, $L(M)=\Sigma^{*}$, the set of all strings.

## Problem (DFA universality)

Input: A DFA $\langle M\rangle$.
Goal: Is M universal?
How do we solve DFA Universality?
We check if $M$ has any reachable non-final state.

## NFA Universality

An NFA $N$ is said to be universal if it accepts every string. That is, $L(N)=\Sigma^{*}$, the set of all strings.

Problem (NFA universality)
Input: $A$ NFA $M$.
Goal: Is M universal?
How do we solve NFA Universality?

## NFA Universality

An NFA $N$ is said to be universal if it accepts every string. That is, $L(N)=\Sigma^{*}$, the set of all strings.

Problem (NFA universality)
Input: $A$ NFA $M$.
Goal: Is M universal?
How do we solve NFA Universality?
Reduce it to DFA Universality?

## NFA Universality

An NFA $N$ is said to be universal if it accepts every string. That is, $L(N)=\Sigma^{*}$, the set of all strings.

Problem (NFA universality)
Input: $A$ NFA $M$.
Goal: Is M universal?
How do we solve NFA Universality?
Reduce it to DFA Universality?
Given an NFA $N$, convert it to an equivalent DFA $M$, and use the DFA Universality Algorithm.

## NFA Universality

An NFA $N$ is said to be universal if it accepts every string. That is, $L(N)=\Sigma^{*}$, the set of all strings.

## Problem (NFA universality)

Input: $A$ NFA $M$.
Goal: Is M universal?
How do we solve NFA Universality?
Reduce it to DFA Universality?
Given an NFA $N$, convert it to an equivalent DFA $M$, and use the DFA Universality Algorithm.
The reduction takes exponential time!
NFA Universality is known to be PSPACE-Complete and we do not expect a polynomial-time algorithm.

## Reasoning about TMs/Programs

- $\langle M\rangle$ is encoding of a TM $M$.
- Equivalently think of $\langle M\rangle$ as the code of a program in some high-level programming language

## Reasoning about TMs/Programs

- $\langle M\rangle$ is encoding of a TM $M$.
- Equivalently think of $\langle M\rangle$ as the code of a program in some high-level programming language

Three related problems:

- Given $\langle M\rangle$ does $M$ halt on blank input? (Halting Problem)
- Given $\langle M, w\rangle$ does $M$ halt on input $w$ ?
- Given $\langle M, w\rangle$ does $M$ accept $\boldsymbol{w}$ ? (Universal Language)

Question: Do any of the above problems have an algorithm?

## Reasoning about TMs/Programs

- $\langle M\rangle$ is encoding of a TM $M$.
- Equivalently think of $\langle M\rangle$ as the code of a program in some high-level programming language

Three related problems:

- Given $\langle M\rangle$ does $M$ halt on blank input? (Halting Problem)
- Given $\langle M, w\rangle$ does $M$ halt on input $w$ ?
- Given $\langle M, w\rangle$ does $M$ accept $\boldsymbol{w}$ ? (Universal Language)

Question: Do any of the above problems have an algorithm?

## Theorem (Turing)

All the three problems are undecidable! No algorithm/program/TM.

## CS 125 assignment

Write a program that prints "Hello World"

```
main() {
    print(''Hello World'')
}
```

## CS 125 assignment

Write a program that prints "Hello World"

```
main() {
    print(''Hello World'')
}
```

Question: Can we create an autograder?

## CS 125 assignment

Write a program that prints "Hello World"

```
main() {
    print(''Hello World'')
}
```

Question: Can we create an autograder? No! Why?

## Reducing Halting to Autograder

- Halting problem: given arbitrary program foo(), does it halt?

## Reducing Halting to Autograder

- Halting problem: given arbitrary program foo(), does it halt?
- Reduction to CS125Autograder: given foo() output foobar()

Note: Reduction only needs to add a few lines of code to foo()

## Reducing Halting to Autograder

- Halting problem: given arbitrary program foo(), does it halt?
- Reduction to CS125Autograder: given foo() output foobar()

Note: Reduction only needs to add a few lines of code to foo()

- foobar() prints "Hello World" if and only if foo() halts!
- If we had CS125Autograder then we can solve Halting. But Halting is hard according to Turing. Hence ...
