

Dynamic Programming

Lecture 13

Recursion types

- 1 **Divide and Conquer**: Problem reduced to multiple **independent** sub-problems.

Examples: Merge sort, quick sort, multiplication, median selection.

Each sub-problem is a fraction smaller.

- 2 **Backtracking**: A sequence of decision problems. Recursion tries all possibilities at each step.

Each subproblem is only a constant smaller, e.g. from n to $n - 1$.

Part I

Fibonacci Numbers

Fibonacci Numbers

Fibonacci numbers defined by recurrence:

$$F(n) = F(n - 1) + F(n - 2) \text{ and } F(0) = 0, F(1) = 1.$$

These numbers have many interesting and amazing properties.
A journal *The Fibonacci Quarterly!*

- ① $F(n) = (\phi^n - (1 - \phi)^n) / \sqrt{5}$ where ϕ is the golden ratio $(1 + \sqrt{5})/2 \simeq 1.618$.
- ② $\lim_{n \rightarrow \infty} F(n + 1)/F(n) = \phi$

Recursive Algorithm for Fibonacci Numbers

Question: Given n , compute $F(n)$.

```
Fib( $n$ ):  
  if ( $n = 0$ )  
    return 0  
  else if ( $n = 1$ )  
    return 1  
  else  
    return Fib( $n - 1$ ) + Fib( $n - 2$ )
```

Recursive Algorithm for Fibonacci Numbers

Question: Given n , compute $F(n)$.

```
Fib( $n$ ):  
  if ( $n = 0$ )  
    return 0  
  else if ( $n = 1$ )  
    return 1  
  else  
    return Fib( $n - 1$ ) + Fib( $n - 2$ )
```

Running time? Let $T(n)$ be the number of additions in $Fib(n)$.

Recursive Algorithm for Fibonacci Numbers

Question: Given n , compute $F(n)$.

```
Fib( $n$ ):  
  if ( $n = 0$ )  
    return 0  
  else if ( $n = 1$ )  
    return 1  
  else  
    return Fib( $n - 1$ ) + Fib( $n - 2$ )
```

Running time? Let $T(n)$ be the number of additions in $\text{Fib}(n)$.

$$T(n) = T(n - 1) + T(n - 2) + 1 \text{ and } T(0) = T(1) = 0$$

Recursive Algorithm for Fibonacci Numbers

Question: Given n , compute $F(n)$.

```
Fib( $n$ ):  
  if ( $n = 0$ )  
    return 0  
  else if ( $n = 1$ )  
    return 1  
  else  
    return Fib( $n - 1$ ) + Fib( $n - 2$ )
```

Running time? Let $T(n)$ be the number of additions in $\text{Fib}(n)$.

$$T(n) = T(n - 1) + T(n - 2) + 1 \text{ and } T(0) = T(1) = 0$$

Roughly same as $F(n)$

$$T(n) = \Theta(\phi^n)$$

The number of additions is exponential in n . Can we do better?

Recursion Tree

Memoization

- The recursive algorithm is slow because it computes the same Fibonacci numbers over and over.

Memoization

- The recursive algorithm is slow because it computes the same Fibonacci numbers over and over.

Memoization

- 1 Write down the results of recursive calls and look them up later

Memoization

- The recursive algorithm is slow because it computes the same Fibonacci numbers over and over.

Memoization

- 1 Write down the results of recursive calls and look them up later
- 2 An array $F(n)$, where $F(i)$ stores the result of $\text{Fib}(i)$

Memoization

- The recursive algorithm is slow because it computes the same Fibonacci numbers over and over.

Memoization

- 1 Write down the results of recursive calls and look them up later
- 2 An array $F(n)$, where $F(i)$ stores the result of $\text{Fib}(i)$
- 3 Evaluation order: From bottom up, $i = 2$ then $i = 3$ and so on

An iterative algorithm for Fibonacci numbers

```
FibIter( $n$ ):  
  if ( $n = 0$ ) then  
    return 0  
  if ( $n = 1$ ) then  
    return 1  
   $F[0] = 0$   
   $F[1] = 1$   
  for  $i = 2$  to  $n$  do  
     $F[i] = F[i - 1] + F[i - 2]$   
  return  $F[n]$ 
```

An iterative algorithm for Fibonacci numbers

```
FibIter( $n$ ):  
  if ( $n = 0$ ) then  
    return 0  
  if ( $n = 1$ ) then  
    return 1  
   $F[0] = 0$   
   $F[1] = 1$   
  for  $i = 2$  to  $n$  do  
     $F[i] = F[i - 1] + F[i - 2]$   
  return  $F[n]$ 
```

What is the running time of the algorithm?

An iterative algorithm for Fibonacci numbers

```
FibIter( $n$ ):  
  if ( $n = 0$ ) then  
    return 0  
  if ( $n = 1$ ) then  
    return 1  
   $F[0] = 0$   
   $F[1] = 1$   
  for  $i = 2$  to  $n$  do  
     $F[i] = F[i - 1] + F[i - 2]$   
  return  $F[n]$ 
```

What is the running time of the algorithm? $O(n)$ additions.

DP prunes recursion tree

What is the difference?

Dynamic Programming:

Finding a recursion that can be *effectively/efficiently* memoized.

Leads to polynomial time algorithm if number of distinct sub-problems is polynomial in input size.

Saving space

Do we need an array of n numbers? Not really.

```
FibIter( $n$ ):  
  if ( $n = 0$ ) then  
    return 0  
  if ( $n = 1$ ) then  
    return 1  
   $prev2 = 0$   
   $prev1 = 1$   
  for  $i = 2$  to  $n$  do  
     $temp = prev1 + prev2$   
     $prev2 = prev1$   
     $prev1 = temp$   
  
  return  $prev1$ 
```

Dynamic Programming

Dynamic Programming: Smart recursion with memoization

Dynamic Programming

Dynamic Programming: Smart recursion with memoization

- **Dynamic programming is not about filling tables. It is about finding a smart recursion. First, find the correct recursion.**

Dynamic Programming

Dynamic Programming: Smart recursion with memoization

- **Dynamic programming is not about filling tables. It is about finding a smart recursion. First, find the correct recursion.**
- Use **memoization** to avoid recomputation of common solutions, hence optimizing running time and space.

Dynamic Programming

Dynamic Programming: Smart recursion with memoization

- **Dynamic programming is not about filling tables. It is about finding a smart recursion. First, find the correct recursion.**
- Use **memoization** to avoid recomputation of common solutions, hence optimizing running time and space.
 - First, allocate a data structure (usually an array or a multi-dimensional array that can hold values for each of the subproblems)
 - Figure out a way to order the computation of the sub-problems starting from the base case.
- Often an *iterative* algorithm with *bottom up* computation.

Part II

Text Segmentation

Problem

Input A string $w \in \Sigma^*$ and access to a language $L \subseteq \Sigma^*$ via function **IsStrInL**(string x) that decides whether x is in L

Goal Decide if $w \in L^*$ using **IsStrInL**(string x) as a black box sub-routine

Example

Suppose L is *English* and we have a procedure to check whether a string/word is in the *English* dictionary.

- Is the string “isthisanenglishsentence” in *English*?
- Is “stampstamp” in *English*?
- Is “zibzzzad” in *English*?

Backtracking

- Changes the problem into a sequence of decision problems
- Each tries all possibilities for the current decision
- Let the recursion fairy make all remaining decisions

Text Segmentation

Backtracking

- Changes the problem into a sequence of decision problems
- Each tries all possibilities for the current decision
- Let the recursion fairy make all remaining decisions

Only the suffix matters.

HEARTHANDSATURNPIN

Text Segmentation

Backtracking

- Changes the problem into a sequence of decision problems
- Each tries all possibilities for the current decision
- Let the recursion fairy make all remaining decisions

Only the suffix matters.

HEARTHANDSATURNSPIN

Base case

- zero-length string

Recursive Solution

Assume w is stored in array $A[1..n]$

```
IsStringInLstar( $A[1..n]$ ):
```

```
  If ( $n = 0$ ) Output YES
```

```
  If (IsStrInL( $A[1..n]$ ))
```

```
    Output YES
```

```
  Else
```

```
    For ( $i = 1$  to  $n - 1$ ) do
```

```
      If (IsStrInL( $A[1..i]$ ) and IsStrInLstar( $A[i + 1..n]$ ))
```

```
        Output YES
```

```
  Output NO
```

Recursive Solution

Assume w is stored in array $A[1..n]$

```
IsStringInLstar( $A[1..n]$ ):  
  If ( $n = 0$ ) Output YES  
  If (IsStrInL( $A[1..n]$ ))  
    Output YES  
  Else  
    For ( $i = 1$  to  $n - 1$ ) do  
      If (IsStrInL( $A[1..i]$ ) and IsStrInLstar( $A[i + 1..n]$ ))  
        Output YES  
  
  Output NO
```

Question: How many distinct sub-problems does **IsStrInLstar**($A[1..n]$) generate?

Recursive Solution

Assume w is stored in array $A[1..n]$

```
IsStringInLstar( $A[1..n]$ ):  
  If ( $n = 0$ ) Output YES  
  If (IsStrInL( $A[1..n]$ ))  
    Output YES  
  Else  
    For ( $i = 1$  to  $n - 1$ ) do  
      If (IsStrInL( $A[1..i]$ ) and IsStrInLstar( $A[i + 1..n]$ ))  
        Output YES  
  
  Output NO
```

Question: How many distinct sub-problems does **IsStrInLstar**($A[1..n]$) generate? $O(n)$

Naming subproblems

After seeing that number of subproblems is $O(n)$ we name them to help us understand the structure better.

ISL(i): a boolean which is **1** if $A[i..n]$ is in L^* , **0** otherwise

Base case: ISL($n + 1$) = 1 interpreting $A[n + 1..n]$ as ϵ

Evaluate subproblems

Recursive relation:

- $ISL(i) = 1$ if $\exists i < j \leq n + 1$ such that ($ISL(j) = 1$ and $IsStrInL(A[i..(j - 1)]) = 1$)
- $ISL(i) = 0$ otherwise

Alternatively: $ISL(i) = \max_{i < j \leq n+1} ISL(j)IsStrInL(A[i..(j - 1)])$

Evaluate subproblems

Recursive relation:

- $ISL(i) = 1$ if $\exists i < j \leq n + 1$ such that ($ISL(j) = 1$ and $IsStrInL(A[i..(j - 1)]) = 1$)
- $ISL(i) = 0$ otherwise

Alternatively: $ISL(i) = \max_{i < j \leq n+1} ISL(j)IsStrInL(A[i..(j - 1)])$

Output: $ISL(1)$

Iterative Algorithm

IsStringInLstar-Iterative($A[1..n]$):

boolean **ISL**[1..($n + 1$)]

ISL[$n + 1$] = **TRUE**

for ($i = n$ down to 1)

ISL[i] = **FALSE**

 for ($j = i + 1$ to $n + 1$)

 If (**ISL**[j] and **IsStrInL**($A[i..j - 1]$))

ISL[i] = **TRUE**

 Break

If (**ISL**[1] = 1) Output YES

Else Output NO

Iterative Algorithm

```
IsStringInLstar-Iterative( $A[1..n]$ ):  
  boolean ISL[1..( $n + 1$ )]  
  ISL[ $n + 1$ ] = TRUE  
  for ( $i = n$  down to 1)  
    ISL[ $i$ ] = FALSE  
    for ( $j = i + 1$  to  $n + 1$ )  
      If (ISL[ $j$ ] and IsStrInL( $A[i..j - 1]$ ))  
        ISL[ $i$ ] = TRUE  
        Break  
  
  If (ISL[1] = 1) Output YES  
  Else Output NO
```

- Running time:

Iterative Algorithm

```
IsStringInLstar-Iterative( $A[1..n]$ ):  
  boolean ISL[ $1..(n + 1)$ ]  
  ISL[ $n + 1$ ] = TRUE  
  for ( $i = n$  down to 1)  
    ISL[ $i$ ] = FALSE  
    for ( $j = i + 1$  to  $n + 1$ )  
      If (ISL[ $j$ ] and IsStrInL( $A[i..j - 1]$ ))  
        ISL[ $i$ ] = TRUE  
        Break  
  
  If (ISL[1] = 1) Output YES  
  Else Output NO
```

- **Running time:** $O(n^2)$ (assuming call to **IsStrInL** is $O(1)$ time)

  Else Output NO
```

- **Running time:** $O(n^2)$ (assuming call to **IsStrInL** is $O(1)$ time)
- **Space:** $O(n)$

How to design DP algorithms

- 1 Find a “smart” recursion (**The hard part**)
 - 1 Formulate the sub-problem
 - 2 so that the number of distinct subproblems is small; polynomial in the original problem size.

How to design DP algorithms

- 1 Find a “smart” recursion (**The hard part**)
 - 1 Formulate the sub-problem
 - 2 so that the number of distinct subproblems is small; polynomial in the original problem size.
- 2 Memoization
 - 1 Identify distinct subproblems
 - 2 Choose a memoization data structure
 - 3 Identify dependencies and find a good evaluation order
 - 4 An iterative algorithm replacing recursive calls with array lookups

Part III

Longest Increasing Subsequence

Longest Increasing Subsequence Problem

Input A sequence of numbers a_1, a_2, \dots, a_n

Goal Find an **increasing subsequence** $a_{i_1}, a_{i_2}, \dots, a_{i_k}$ of maximum length

Longest Increasing Subsequence Problem

Input A sequence of numbers a_1, a_2, \dots, a_n

Goal Find an **increasing subsequence** $a_{i_1}, a_{i_2}, \dots, a_{i_k}$ of maximum length

Example

- 1 Sequence: 6, 3, 5, 2, 7, 8, 1
- 2 Increasing subsequences: 6, 7, 8 and 3, 5, 7, 8 and 2, 7 etc
- 3 Longest increasing subsequence: 3, 5, 7, 8

Recursive Approach: Take 1

LIS: Longest increasing subsequence

Can we find a recursive algorithm for LIS?

LIS($A[1..n]$):

- 1 **Case 1:** Does not contain $A[n]$ in which case $LIS(A[1..n]) = LIS(A[1..(n-1)])$
- 2 **Case 2:** contains $A[n]$ in which case LIS($A[1..n]$) is not so clear.

Recursive Approach: Take 1

LIS: Longest increasing subsequence

Can we find a recursive algorithm for LIS?

LIS($A[1..n]$):

- 1 **Case 1:** Does not contain $A[n]$ in which case $LIS(A[1..n]) = LIS(A[1..(n-1)])$
- 2 **Case 2:** contains $A[n]$ in which case $LIS(A[1..n])$ is not so clear.

Observation

For second case we want to find a subsequence in $A[1..(n-1)]$ that is restricted to numbers less than $A[n]$. This suggests that a more general problem is $LIS_smaller(A[1..n], x)$ which gives the longest increasing subsequence in A where each number in the sequence is less than x .

Recursive Approach

$LIS(A[1..n])$: the length of longest increasing subsequence in A

$LIS_smaller(A[1..n], x)$: length of longest increasing subsequence in $A[1..n]$ with all numbers in subsequence less than x

```
LIS_smaller( $A[1..n], x$ ):  
  if ( $n = 0$ ) then return 0  
   $m = LIS\_smaller(A[1..(n - 1)], x)$   
  if ( $A[n] < x$ ) then  
     $m = \max(m, 1 + LIS\_smaller(A[1..(n - 1)], A[n]))$   
  Output  $m$ 
```

```
 $LIS(A[1..n])$ :  
  return  $LIS\_smaller(A[1..n], \infty)$ 
```

Recursive Approach

```
LIS_smaller( $A[1..n]$ ,  $x$ ):  
  if ( $n = 0$ ) then return 0  
   $m = \text{LIS\_smaller}(A[1..(n - 1)], x)$   
  if ( $A[n] < x$ ) then  
     $m = \max(m, 1 + \text{LIS\_smaller}(A[1..(n - 1)], A[n]))$   
  Output  $m$ 
```

```
LIS( $A[1..n]$ ):  
  return LIS_smaller( $A[1..n]$ ,  $\infty$ )
```

- How many distinct sub-problems will **LIS_smaller**($A[1..n]$, ∞) generate?

Recursive Approach

```
LIS_smaller( $A[1..n]$ ,  $x$ ):  
  if ( $n = 0$ ) then return 0  
   $m = \text{LIS\_smaller}(A[1..(n - 1)], x)$   
  if ( $A[n] < x$ ) then  
     $m = \max(m, 1 + \text{LIS\_smaller}(A[1..(n - 1)], A[n]))$   
  Output  $m$ 
```

```
LIS( $A[1..n]$ ):  
  return LIS_smaller( $A[1..n]$ ,  $\infty$ )
```

- How many distinct sub-problems will **LIS_smaller**($A[1..n]$, ∞) generate? $O(n^2)$

Recursive Approach

```
LIS_smaller( $A[1..n]$ ,  $x$ ):  
  if ( $n = 0$ ) then return 0  
   $m = \text{LIS\_smaller}(A[1..(n - 1)], x)$   
  if ( $A[n] < x$ ) then  
     $m = \max(m, 1 + \text{LIS\_smaller}(A[1..(n - 1)], A[n]))$   
  Output  $m$ 
```

```
LIS( $A[1..n]$ ):  
  return LIS_smaller( $A[1..n]$ ,  $\infty$ )
```

- How many distinct sub-problems will **LIS_smaller**($A[1..n]$, ∞) generate? $O(n^2)$
- What is the running time if we memoize recursion?

Recursive Approach

```
LIS_smaller( $A[1..n]$ ,  $x$ ):  
  if ( $n = 0$ ) then return 0  
   $m = \text{LIS\_smaller}(A[1..(n - 1)], x)$   
  if ( $A[n] < x$ ) then  
     $m = \max(m, 1 + \text{LIS\_smaller}(A[1..(n - 1)], A[n]))$   
  Output  $m$ 
```

```
LIS( $A[1..n]$ ):  
  return LIS_smaller( $A[1..n]$ ,  $\infty$ )
```

- How many distinct sub-problems will **LIS_smaller**($A[1..n]$, ∞) generate? $O(n^2)$
- What is the running time if we memoize recursion? $O(n^2)$ since each call takes $O(1)$ time to assemble the answers from two recursive calls and no other computation.

Recursive Approach

```
LIS_smaller( $A[1..n]$ ,  $x$ ):  
  if ( $n = 0$ ) then return 0  
   $m = \text{LIS\_smaller}(A[1..(n - 1)], x)$   
  if ( $A[n] < x$ ) then  
     $m = \max(m, 1 + \text{LIS\_smaller}(A[1..(n - 1)], A[n]))$   
  Output  $m$ 
```

```
LIS( $A[1..n]$ ):  
  return LIS_smaller( $A[1..n]$ ,  $\infty$ )
```

- How many distinct sub-problems will **LIS_smaller**($A[1..n]$, ∞) generate? $O(n^2)$
- What is the running time if we memoize recursion? $O(n^2)$ since each call takes $O(1)$ time to assemble the answers from two recursive calls and no other computation.
- How much space for memoization?

Recursive Approach

```
LIS_smaller( $A[1..n]$ ,  $x$ ):  
  if ( $n = 0$ ) then return 0  
   $m = \text{LIS\_smaller}(A[1..(n - 1)], x)$   
  if ( $A[n] < x$ ) then  
     $m = \max(m, 1 + \text{LIS\_smaller}(A[1..(n - 1)], A[n]))$   
  Output  $m$ 
```

```
LIS( $A[1..n]$ ):  
  return LIS_smaller( $A[1..n]$ ,  $\infty$ )
```

- How many distinct sub-problems will **LIS_smaller**($A[1..n]$, ∞) generate? $O(n^2)$
- What is the running time if we memoize recursion? $O(n^2)$ since each call takes $O(1)$ time to assemble the answers from two recursive calls and no other computation.
- How much space for memoization? $O(n^2)$

Naming subproblems and recursive equation

After seeing that number of subproblems is $O(n^2)$ we name them to help us understand the structure better. For notational ease we add ∞ at end of array (in position $n + 1$)

$LIS(i, j)$: length of longest increasing sequence in $A[1..i]$ among numbers less than $A[j]$ (defined only for $i < j$)
