

## Functions Over Lists

```
# let silly = double_up ["hi"; "there"];;
val silly : string list = ["hi"; "hi"; "there"; "there"]
# let rec poor_rev list =
    match list
    with [] -> []
        | (x::xs) -> poor_rev xs @ [x];;
val poor_rev : 'a list -> 'a list = <fun>
# poor_rev silly;;
- : string list = ["there"; "there"; "hi"; "hi"]
```

## Same Length

- How can we efficiently answer if two lists have the same length?
let rec same_length list1 list2 =
match list1 with [] ->
(match list2 with [] -> true
| (y::ys) -> false)
| (x::xs) ->
(match list2 with [] -> false | (y::ys) -> same_length xs ys)

## Functions Over Lists

\# let rec double_up list = match list
with [ ] -> [ ] (* pattern before ->, expression after *)
| (x :: xs) -> (x :: x :: double_up xs);; val double_up : 'a list -> 'a list = <fun> \# let fib5_2 = double_up fib5;;
val fib5_2 : int list = $[8 ; 8 ; 5 ; 5 ; 3 ; 3 ; 2 ; 2 ; 1$; $1 ; 1 ; 1]$

## Same Length

- How can we efficiently answer if two lists have the same length?

Your turn: doubleList : int list -> int list

- Write a function that takes a list of int and returns a list of the same length, where each element has been multiplied by 2
let rec doubleList list =

Your turn: doubleList : int list -> int list

- Write a function that takes a list of int and returns a list of the same length, where each element has been multiplied by 2
let rec doubleList list = match list
with [] ->[]
| x :: xs -> $\left(2{ }^{*} \mathrm{x}\right)::$ doubleList xs

## Higher-Order Functions Over Lists

\# let rec map f list = match list
with [] -> []
| (h::t) -> (f h) :: (map ft);;
val map : ('a -> 'b) -> 'a list -> 'b list = <fun> \# map plus_two fib5;;

- : int list = [10; 7; 5; 4; 3; 3]
\# map (fun x -> x - 1) fib6;;
: int list = [12; 7; 4; 2; 1; 0; 0]

## Mapping Recursion

- Can use the higher-order recursive map function instead of direct recursion
\# let doubleList list =
List.map (fun x -> 2 * x) list;;
val doubleList : int list -> int list $=$ <fun> \# doubleList [2;3;4];;
- : int list = [4; 6; 8]

Your turn: doubleList : int list -> int list

- Write a function that takes a list of int and returns a list of the same length, where each element has been multiplied by 2
let rec doubleList list = match list

## Higher-Order Functions Over Lists

\# let rec map f list = match list
with [] $\rightarrow$ []
I (h: :t) $->(\mathrm{f} \mathrm{h})::(\operatorname{map~ft);}$;
val map: ('a-> 'b) -> 'a list -> 'b list = <fun> \# map plus_two fib5;;

- : int list = [10; 7; 5; 4; 3; 3]
\# map (fun x-> x-1) fib6;;
: int list = [12; 7; 4; 2; 1; 0; 0]

2/1/23

## Mapping Recursion

- Can use the higher-order recursive map function instead of direct recursion
\# let doubleList list =
List.map (fun x -> 2 * x) list;;
val doubleList : int list $->$ int list $=<$ fun $>$
\# doubleList [2;3;4];;
- : int list = [4; 6; 8]
- Same function, but no explicit recursion

## Folding Recursion

Another common form "folds" an operation over the elements of the structure
\# let rec multList list = match list with [ ] -> 1
| x::xs -> x * multList xs;;
val multList : int list -> int = <fun>
\# multList [2;4;6];;

- : int = 48
- Computes (2 * (4 * (6 * 1)))

## Forward Recursion

- In Structural Recursion, split input into components and (eventually) recurse
- Forward Recursion form of Structural Recursion
- In forward recursion, first call the function recursively on all recursive components, and then build final result from partial results
- Wait until whole structure has been traversed to start building answer

2/1/23

## Forward Recursion: Examples

```
    # let rec double_up list =
    match list
    with [ ] -> []
            | (x :: xs`)
val double_up : 'a list ->+'a list = < funhz
        Base Case Operator Recursive Call
    # let rec poor_rev list =
    match list
    with [] -> []
        | (x::xs) )-> let r = poor rev xs in r@ [x];;
val poor_rev:'a list -> 'a list = <fuy's
Base Case Operator Recursive Call

\section*{Recursing over lists}
\# let rec fold_right f list b = match list
with [] -> b

| (x :: xs) -> f x (fold_right f xs b); Recursion Fairy
val fold_right : ('a -> 'b -> 'b) -> 'a list -> 'b -> 'b = <fun>
\# fold_right
(fun \(\mathrm{s}->\) fun () -> print_string s)
["hi"; "there"]
();
therehi- : unit \(=() w\)

\section*{Folding Recursion : Length Example}
\# let rec length list = match list
with [ ] -> 0 (* Nil case *)
| a :: bs -> 1 + length bs;; (* Cons case *)
val length : 'a list -> int = <fun>
\# let length list =
fold_right (fun a -> fun r-> \(1+r\) ) list \(0 ;\);
val length : 'a list -> int \(=\) <fun>
\# length [5; 4; 3; 2] i;
- : int = 4

\section*{Forward Recursion: Examples}
\# let rec double_up list = match list with [ ] -> [ ]
| (x :: xs) \({ }^{->}\)(x :: x :: double_up xs); ;
val double/up : 'a list \(->\) 个'a list \(=\) < funt
Base Case Operator Recursive Call \# let double_up =
fold_right (fun \(x->\) fun \(r->x:: x:: r\) r) list []
Operator Recursive result Base Case \# double_up ["a";"b"];;
- : string list = ["a"; "a"; "b"; "b"]

Encoding Forward Recursion with Fold
\# let rec append list1 list2 = match list1 with
val append : 'a list -> 'a list -> 'a list = <fun>

\section*{Folding Recursion}
- multList folds to the right
- Same as:
\# let multList list =
List.fold_right
(fun \(x->\) fun \(p->x\) * )
list 1;
val multList : int list -> int = <fun>
\# multList [2;4;6];;
- : int = 48

\section*{Encoding Forward Recursion with Fold}
\# let rec append list1 list2 =
val append : 'a list -> 'a list -> 'a list = <fun>

\section*{Encoding Forward Recursion with Fold}
\# let rec append list1 list2 = match list1 with [ ] -> list2
val append : 'a list -> 'a list -> 'a list = <fun>

\section*{Encoding Forward Recursion with Fold}
\# let rec append list1 list2 = match list1 with [ ] -> list2
val append : 'a list -> 'a list -> 'a list = <fun> Base Case

\section*{Encoding Forward Recursion with Fold}
\# let rec append list1 list2 = match list1 with
[ ] -> list2 x::xs -> x :: append xs list2;; val append : 'a list -> 'a list -> 'a list = <fun>
```

Base Case

```

\section*{Encoding Forward Recursion with Fold}
\# let rec append list1 list2 = match list1 with [ ] -> list2 x: :xs ->
val append : 'a list -> 'a list -> 'a list = <fun>

\section*{Base Case}

\section*{Encoding Forward Recursion with Fold}
\# let rec append list1 list2 = match list1 with [ ] -> list2| x::xs -> x :: append xs list2;; val append : 'a list -> 'a/list -> 'alist = <fun>

> \begin{tabular}{l|l|} \hline Base Case & Operation \\ & Recursive Call \\ \hline \end{tabular}

\section*{Encoding Forward Recursion with Fold}
\# let rec append list1 list2 = match list1 with
[ ] -> list2 x::xs -> \(x\) :: append xs list2;;
val append : 'a list -> 'a/list -> 'alist = <fun>

val append : 'a list -> 'a list -> 'a list = <fun>
\# append \([1 ; 2 ; 3][4 ; 5 ; 6]\);;
- : int list = \(1 ; 2 ; 3 ; 4 ; 5 ; 6]\)

2/1/23

\section*{Tail Recursion}
- A recursive program is tail recursive if all recursive calls are tail calls
- Tail recursive programs may be optimized to be implemented as loops, thus removing the function call overhead for the recursive calls
- Tail recursion generally requires extra "accumulator" arguments to pass partial results
- May require an auxiliary function

\section*{Terminology}
- Tail Position: A subexpression s of expressions e, which is available and such that if evaluated, will be taken as the value of \(e\)
- if \((x>3)\) then \(x+2\) else \(x-4\)
- let \(x=5\) in \(x+4\)
- Tail Call: A function call that occurs in tail position
- if \((h x)\) then \(f x\) else ( \(x \pm g x)\)

\section*{Terminology}
- Available: A function call that can be executed by the current expression
- The fastest way to be unavailable is to be guarded by an abstraction (anonymous function lambda lifted).
- if \((h x)\) then \(f x\) else \((x+g x)\)
- if \((h x)\) then (fun \(x->f x\) ) else \((g(x+x))\)

Not available

\section*{Tail Recursion - length}
- How can we write length with tail recursion?
let length list =
let rec length_aux list acc_length = match list
with [] -> acc_length
| (x::xs) ->
length_aux xs (1 + acc_length)
in length_aux list 0```
