Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

Functions Over Lists

```
# let rec double_up list =  
  match list  
  with [ ] -> [ ] (* pattern before ->,  
                  expression after *)  
       | (x :: xs) -> (x :: x :: double_up xs);;  
val double_up : 'a list -> 'a list = <fun>  
# let fib5_2 = double_up fib5;;  
val fib5_2 : int list = [8; 8; 5; 5; 3; 3; 2; 2; 1;  
1; 1; 1]
```

Functions Over Lists

```
# let silly = double_up ["hi"; "there"];;
val silly : string list = ["hi"; "hi"; "there"; "there"]
# let rec poor_rev list =
  match list
  with [] -> []
       | (x::xs) -> poor_rev xs @ [x];;
val poor_rev : 'a list -> 'a list = <fun>
# poor_rev silly;;
- : string list = ["there"; "there"; "hi"; "hi"]
```

Same Length

- How can we efficiently answer if two lists have the same length?

Same Length

- How can we efficiently answer if two lists have the same length?

```
let rec same_length list1 list2 =  
  match list1 with [] ->  
    (match list2 with [] -> true  
     | (y::ys) -> false)  
  | (x::xs) ->  
    (match list2 with [] -> false  
     | (y::ys) -> same_length xs ys)
```

Your turn: `doubleList : int list -> int list`

- Write a function that takes a list of int and returns a list of the same length, where each element has been multiplied by 2

`let rec doubleList list =`

Your turn: `doubleList : int list -> int list`

- Write a function that takes a list of `int` and returns a list of the same length, where each element has been multiplied by 2

```
let rec doubleList list =
```

```
  match list
```

```
    with [] -> []
```

```
      | x :: xs -> (2 * x) :: doubleList xs
```

Your turn: `doubleList : int list -> int list`

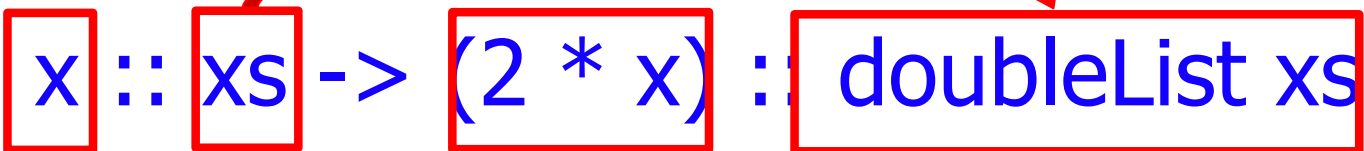

- Write a function that takes a list of `int` and returns a list of the same length, where each element has been multiplied by 2

`let rec doubleList list =`

`match list`

`with [] -> []`

`| x :: xs -> (2 * x) :: doubleList xs`

Higher-Order Functions Over Lists

```
# let rec map f list =  
  match list  
  with [] -> []  
       | (h::t) -> (f h) :: (map f t);;  
val map : ('a -> 'b) -> 'a list -> 'b list = <fun>  
# map plus_two fib5;;  
- : int list = [10; 7; 5; 4; 3; 3]  
# map (fun x -> x - 1) fib6;;  
: int list = [12; 7; 4; 2; 1; 0; 0]
```

Higher-Order Functions Over Lists

```
# let rec map f list =
```

```
  match list
```

```
  with [] -> []
```

```
  | (h::t) -> (f h) :: (map f t);;
```

```
val map : ('a -> 'b) -> 'a list -> 'b list = <fun>
```

```
# map plus_two fib5;;
```

```
- : int list = [10; 7; 5; 4; 3; 3]
```

```
# map (fun x -> x - 1) fib6;;
```

```
: int list = [12; 7; 4; 2; 1; 0; 0]
```

Mapping Recursion

- Can use the higher-order recursive map function instead of direct recursion

```
# let doubleList list =  
  List.map (fun x -> 2 * x) list;;  
val doubleList : int list -> int list = <fun>  
# doubleList [2;3;4];;  
- : int list = [4; 6; 8]
```

Mapping Recursion

- Can use the higher-order recursive map function instead of direct recursion

```
# let doubleList list =
```

```
  List.map (fun x -> 2 * x) list;;
```

```
val doubleList : int list -> int list = <fun>
```

```
# doubleList [2;3;4];;
```

```
- : int list = [4; 6; 8]
```

- Same function, but no explicit recursion

Folding Recursion

- Another common form “folds” an operation over the elements of the structure

```
# let rec multList list = match list
  with [ ] -> 1
       | x::xs -> x * multList xs;;
val multList : int list -> int = <fun>
# multList [2;4;6];;
- : int = 48
```

- Computes $(2 * (4 * (6 * 1)))$

Folding Recursion : Length Example

```
# let rec length list = match list
  with [ ] -> 0 (* Nil case *)
       | a :: bs -> 1 + length bs;; (* Cons case *)
```

```
val length : 'a list -> int = <fun>
```

```
# length [5; 4; 3; 2];;
```

```
- : int = 4
```

- Nil case [] is base case, 0 is the base value
- Cons case recurses on component list bs
- What do multList and length have in common?

Forward Recursion

- In Structural Recursion, split input into components and (eventually) recurse
- Forward Recursion form of Structural Recursion
- In forward recursion, first call the function recursively on all recursive components, and then build final result from partial results
- Wait until whole structure has been traversed to start building answer

Forward Recursion: Examples

```
# let rec double_up list =  
  match list  
  with [ ] -> [ ]  
       | (x :: xs) -> (x :: x :: double_up xs);;  
val double_up : 'a list -> 'a list = <fun>
```

```
# let rec poor_rev list =  
  match list  
  with [] -> []  
       | (x::xs) -> let r = poor_rev xs in r @ [x];;  
val poor_rev : 'a list -> 'a list = <fun>
```

Forward Recursion: Examples

```
# let rec double_up list =  
  match list  
  with [ ] -> [ ]  
       | (x :: xs) -> (x :: x :: double_up xs);;  
val double_up : 'a list -> 'a list = <fun>
```

Base Case

Operator

Recursive Call

```
# let rec poor_rev list =  
  match list  
  with [] -> []  
       | (x::xs) -> let r = poor_rev xs in r @ [x];;  
val poor_rev : 'a list -> 'a list = <fun>
```

Base Case

Operator

Recursive Call

Recurasing over lists

The Primitive
Recursion Fairy

```
# let rec fold_right f list b =  
  match list  
  with [] -> b  
       | (x :: xs) -> f x (fold_right f xs b);;  
val fold_right : ('a -> 'b -> 'b) -> 'a list -> 'b -> 'b =  
  <fun>  
# fold_right  
  (fun s -> fun () -> print_string s)  
  ["hi"; "there"]  
  ();;  
therehi- : unit = ()w
```

Folding Recursion : Length Example

```
# let rec length list = match list
  with [ ] -> 0 (* Nil case *)
       | a :: bs -> 1 + length bs;; (* Cons case *)
val length : 'a list -> int = <fun>
# let length list =
  fold_right (fun a -> fun r -> 1 + r) list 0;;
val length : 'a list -> int = <fun>
# length [5; 4; 3; 2];;
- : int = 4
```

Folding Recursion

- multList folds to the right
- Same as:

```
# let multList list =  
  List.fold_right  
    (fun x -> fun p -> x * p)  
    list 1;;  
  
val multList : int list -> int = <fun>  
  
# multList [2;4;6];;  
- : int = 48
```

Forward Recursion: Examples

```
# let rec double_up list =  
  match list  
  with [ ] -> [ ]  
       | (x :: xs) -> (x :: x :: double_up xs);;  
val double_up : 'a list -> 'a list = <fun>
```

Base Case

Operator

Recursive Call

```
# let double_up =  
  fold_right (fun x -> fun r -> x :: x :: r) list [ ]
```

Operator

Recursive result

Base Case

```
# double_up ["a";"b"];;  
- : string list = ["a"; "a"; "b"; "b"]
```

Encoding Forward Recursion with Fold

```
# let rec append list1 list2 =
```

```
val append : 'a list -> 'a list -> 'a list = <fun>
```

Encoding Forward Recursion with Fold

```
# let rec append list1 list2 = match list1 with
```

```
val append : 'a list -> 'a list -> 'a list = <fun>
```

Encoding Forward Recursion with Fold

```
# let rec append list1 list2 = match list1 with  
  [ ] -> list2
```

```
val append : 'a list -> 'a list -> 'a list = <fun>
```

Encoding Forward Recursion with Fold

```
# let rec append list1 list2 = match list1 with
```

```
[ ] -> list2
```

```
val append : 'a list -> 'a list -> 'a list = <fun>
```

Base Case

Encoding Forward Recursion with Fold

```
# let rec append list1 list2 = match list1 with
```

```
[ ] -> list2 | x::xs ->
```

```
val append : 'a list -> 'a list -> 'a list = <fun>
```

Base Case

Encoding Forward Recursion with Fold

```
# let rec append list1 list2 = match list1 with  
  [ ] -> list2 | x::xs -> x :: append xs list2;;  
val append : 'a list -> 'a list -> 'a list = <fun>
```

Base Case

Encoding Forward Recursion with Fold

```
# let rec append list1 list2 = match list1 with  
  [ ] -> list2 | x::xs -> x :: append xs list2;;  
val append : 'a list -> 'a list -> 'a list = <fun>
```

Base Case

Operation

Recursive Call

Encoding Forward Recursion with Fold

```
# let rec append list1 list2 = match list1 with  
[ ] -> list2 | x::xs -> x :: append xs list2;;  
val append : 'a list -> 'a list -> 'a list = <fun>
```

Base Case

Operation

Recursive Call

```
# let append list1 list2 =  
  fold_right (fun x -> fun y -> x :: y) list1 list2;;  
val append : 'a list -> 'a list -> 'a list = <fun>
```

Encoding Forward Recursion with Fold

```
# let rec append list1 list2 = match list1 with  
  [ ] -> list2 | x::xs -> x :: append xs list2;;  
val append : 'a list -> 'a list -> 'a list = <fun>
```

Base Case

Operation

Recursive Call

```
# let append list1 list2 =  
  fold_right (fun x -> fun y -> x :: y) list1 list2;;  
val append : 'a list -> 'a list -> 'a list = <fun>
```

```
# append [1;2;3] [4;5;6];;
```

```
- : int list = [1; 2; 3; 4; 5; 6]
```

Tail Recursion

- A recursive program is tail recursive if all recursive calls are tail calls
- Tail recursive programs may be optimized to be implemented as loops, thus removing the function call overhead for the recursive calls
- Tail recursion generally requires extra “accumulator” arguments to pass partial results
 - May require an auxiliary function

Terminology

- **Available:** A function call that can be executed by the current expression
- The fastest way to be unavailable is to be guarded by an abstraction (anonymous function, lambda lifted).

- if `(h x)` then `f x` else `(x + g x)`

- if `(h x)` then `(fun x -> f x)` else `(g (x + x))`

Not available

Terminology

- Tail Position: A subexpression s of expressions e , which is **available** and such that if evaluated, will be taken as the value of e
 - if $(x > 3)$ then $x + 2$ else $x - 4$
 - let $x = 5$ in $x + 4$
- Tail Call: A function call that occurs in tail position
 - if $(h\ x)$ then $f\ x$ else $(x\ \underline{+}\ g\ x)$

Tail Recursion - length

- How can we write length with tail recursion?

```
let length list =
```

```
  let rec length_aux list acc_length =
```

```
    match list
```

```
      with [ ] -> acc_length
```

```
      | (x::xs) ->
```

```
        length_aux xs (1 + acc_length)
```

```
  in length_aux list 0
```
