

802.11ax

High Efficiency WLANs

Federico Cifuentes-Urtubey

CS 439

University of Illinois Urbana-Champaign

Legacy 802.11 Standards

Early Wi-Fi standards: 802.11a/b/g

802.11b

1999

2.4 GHz
Up to 11 Mbps
DSSS modulation

802.11a

1999

5 GHz
Up to 54 Mbps
OFDM modulation

802.11g

2003

2.4 + 5 GHz
Up to 54 Mbps
DSSS + OFDM

Trade-offs between range, speed, and frequency bands

802.11n – Precursor to Modern Wi-Fi

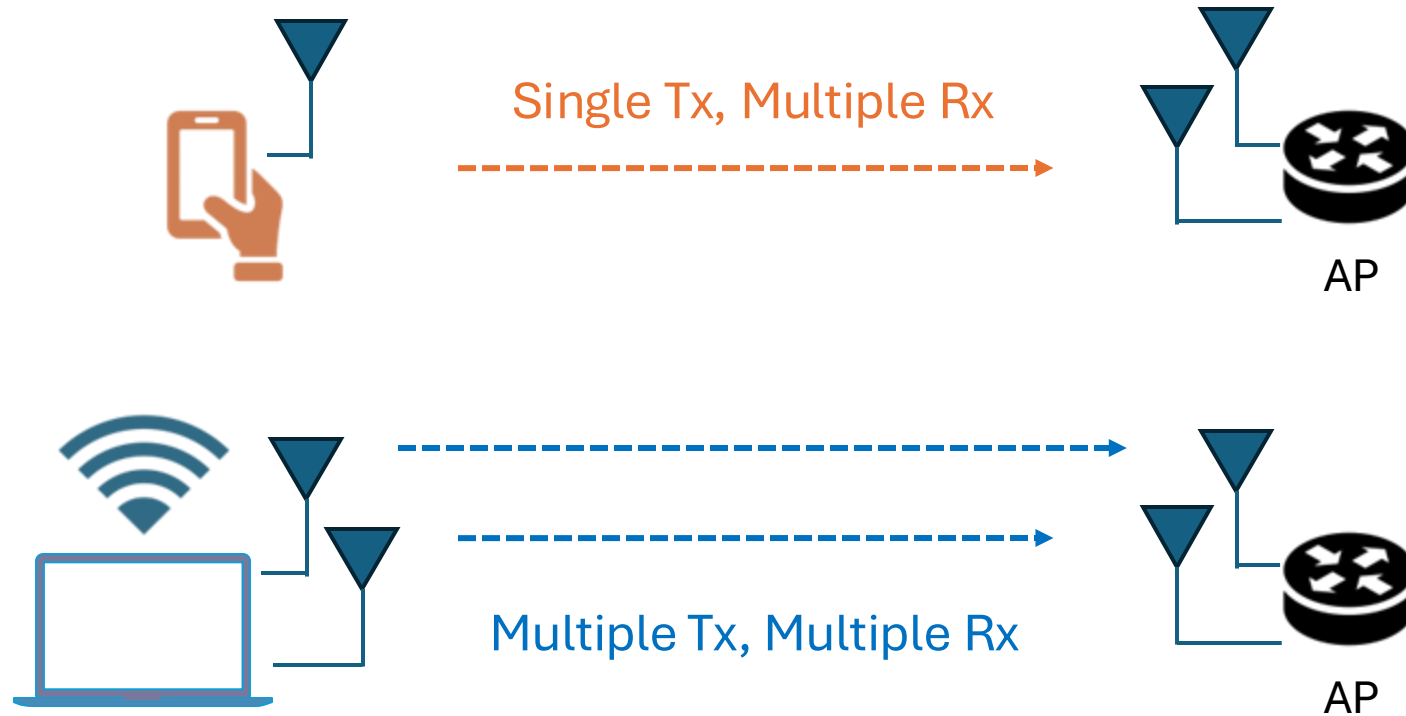

Introduced **MIMO** (Multiple input, Multiple output)

Dual-band operation on 2.4 GHz and 5 GHz

Theoretical max of **600 Mbps**

MIMO

Multiplies the capacity of a link using multiple Tx and Rx antennas

802.11ac – The Bridge to Wi-Fi 6

Increased data rates to 3.5 Gbps

Operates only in the 5 GHz band

DL MU-MIMO: Router transmits to multiple clients

Downlink MU-MIMO

AP transmits separate spatial streams to multiple clients at once

DL MU-MIMO Constraints

- ✗ Only worked with up to 4 client devices
- ✗ Clients still need to take turns when transmitting
- ✗ Requires Channel State Information feedback from clients (management traffic overhead)
- ✗ No uplink synchronization

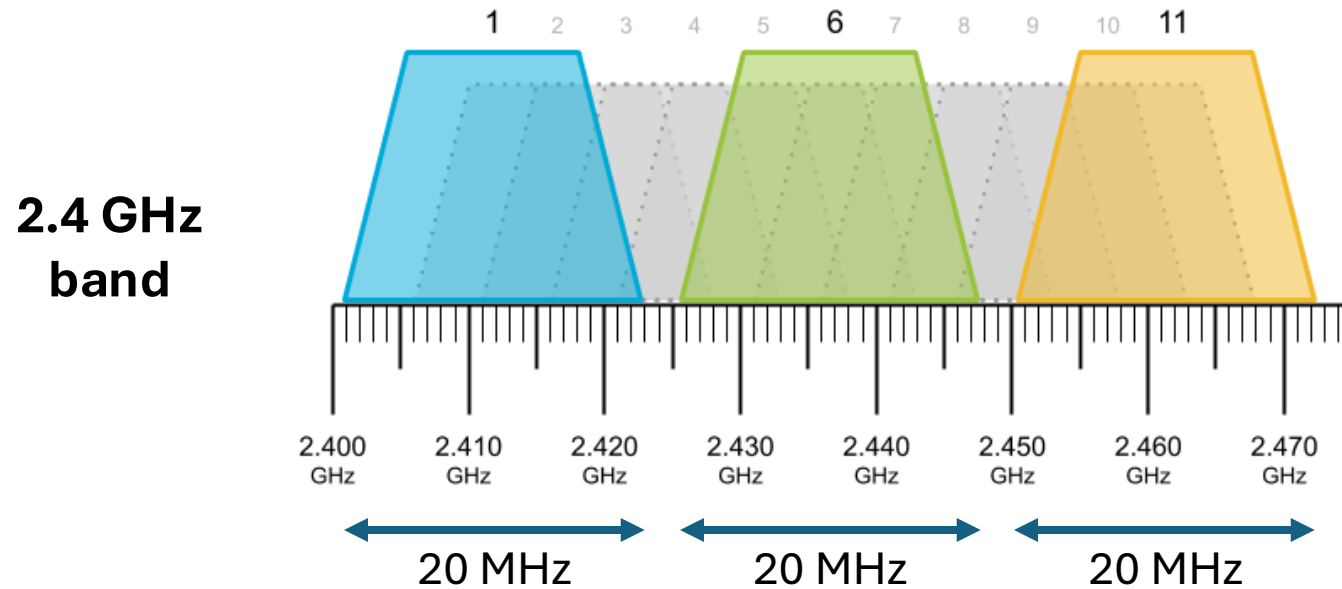

Limitations of Legacy Standards

- Multiuser scheduling **only worked on the downlink**
- **Dense areas** suffered from low throughput, interference
- **High MAC layer overhead** for short frames
- **Power consumption** vs. Higher data rates
- QoS for time-sensitive apps needed improvement

802.11ax – Wi-Fi Today

But first, a little more background

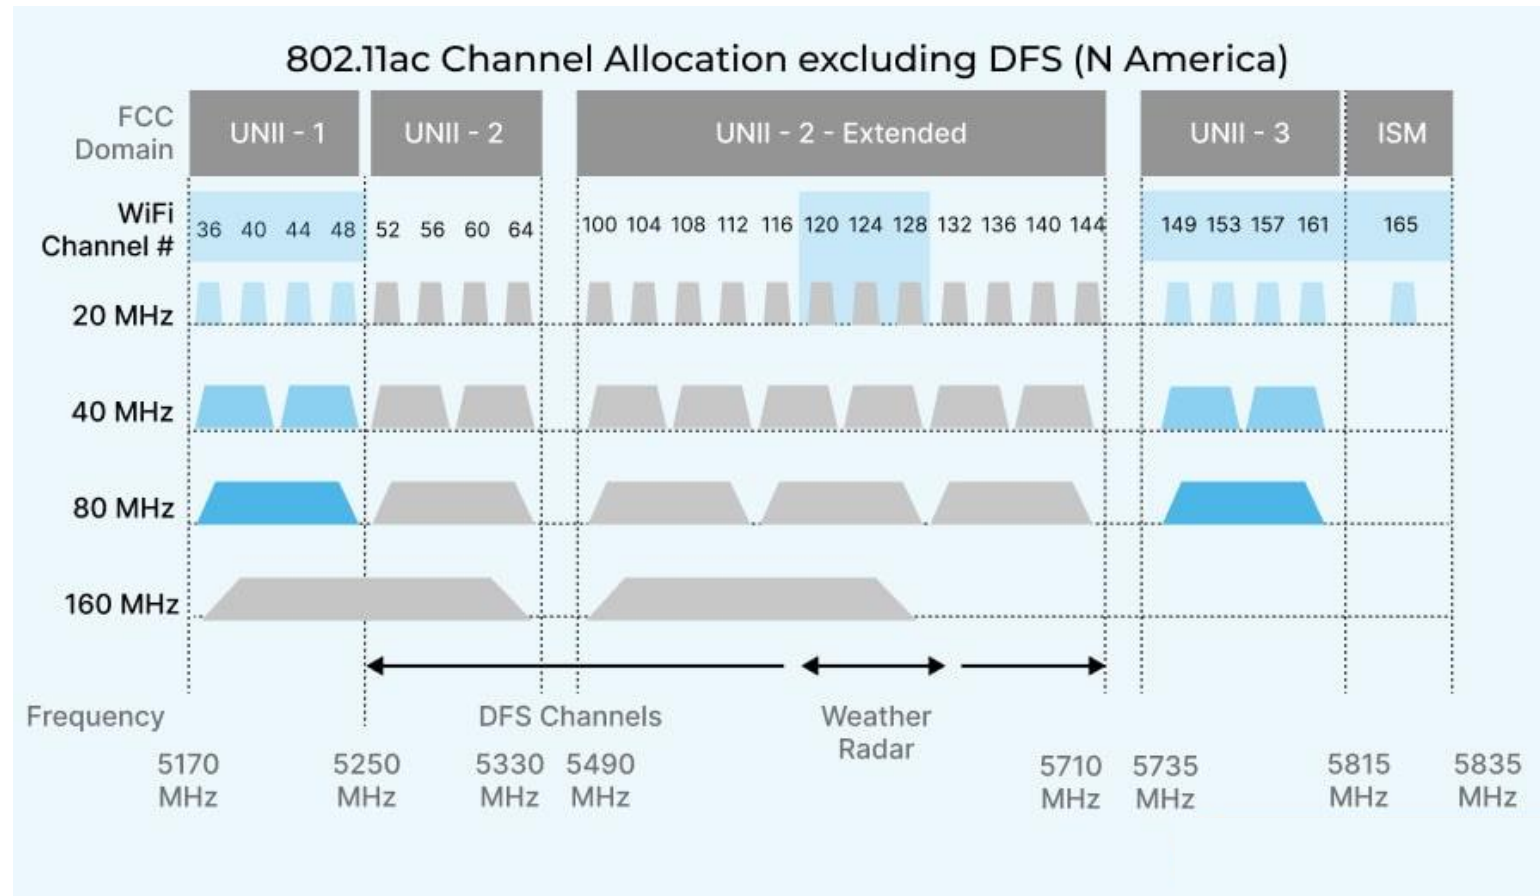

802.11 Channel Bands

APs and devices on the 2.4 GHz band should operate on these channels to reduce interference

802.11 Channel Bands

**5 GHz
band**

Wi-Fi 5 uses fixed bandwidth, but not all devices need it

802.11ax: High Efficiency WLANs

High Efficiency (HE) operation on both uplink and downlink

- OFDMA: Divides subcarriers into Resource Units (RUs)
- Difference from MU-MIMO: divide bandwidth instead of different spatial streams
- Uplink OFDMA enables multiuser access without requiring an entire channel for each user

Key Features of 802.11ax

Speed improvement of up to 9.6 Gbps

Channel Capacity improvements

- OFDMA
- 160 MHz channels

Efficiency improvements

- BSS Coloring
- Target Wake Time

OFDMA

- **O**rthogonal **F**requency **D**ivision **M**ultiple **A**ccess
- Splits subcarriers (frequencies) into groups of bandwidths
- Shares the channel among multiple devices simultaneously

OFDM vs. OFDMA

	OFDM Orthogonal Frequency Division Multiplexing	OFDMA Orthogonal Frequency Division Multiple Access
Resource Granularity	All subcarriers act as one block for one STA	Subcarriers are partitioned into groups (RUs) , allocated per STA
Efficiency	Idle airtime if a user has little data (wasted channel use)	Better efficiency, multiple small packets from different users fit in parallel
Latency	Higher, because users wait for their turn to use the full channel	Lower, since multiple users can transmit in the same time slot
Uplink Support	One STA per transmission, collisions possible without coordination	AP coordinates STAs via Trigger frames , synchronized uplink transmissions
Design Influence on Traffic patterns	Good for high-throughput single-user streams	Good for mixed traffic with many small packets

OFDM (Previous generations)

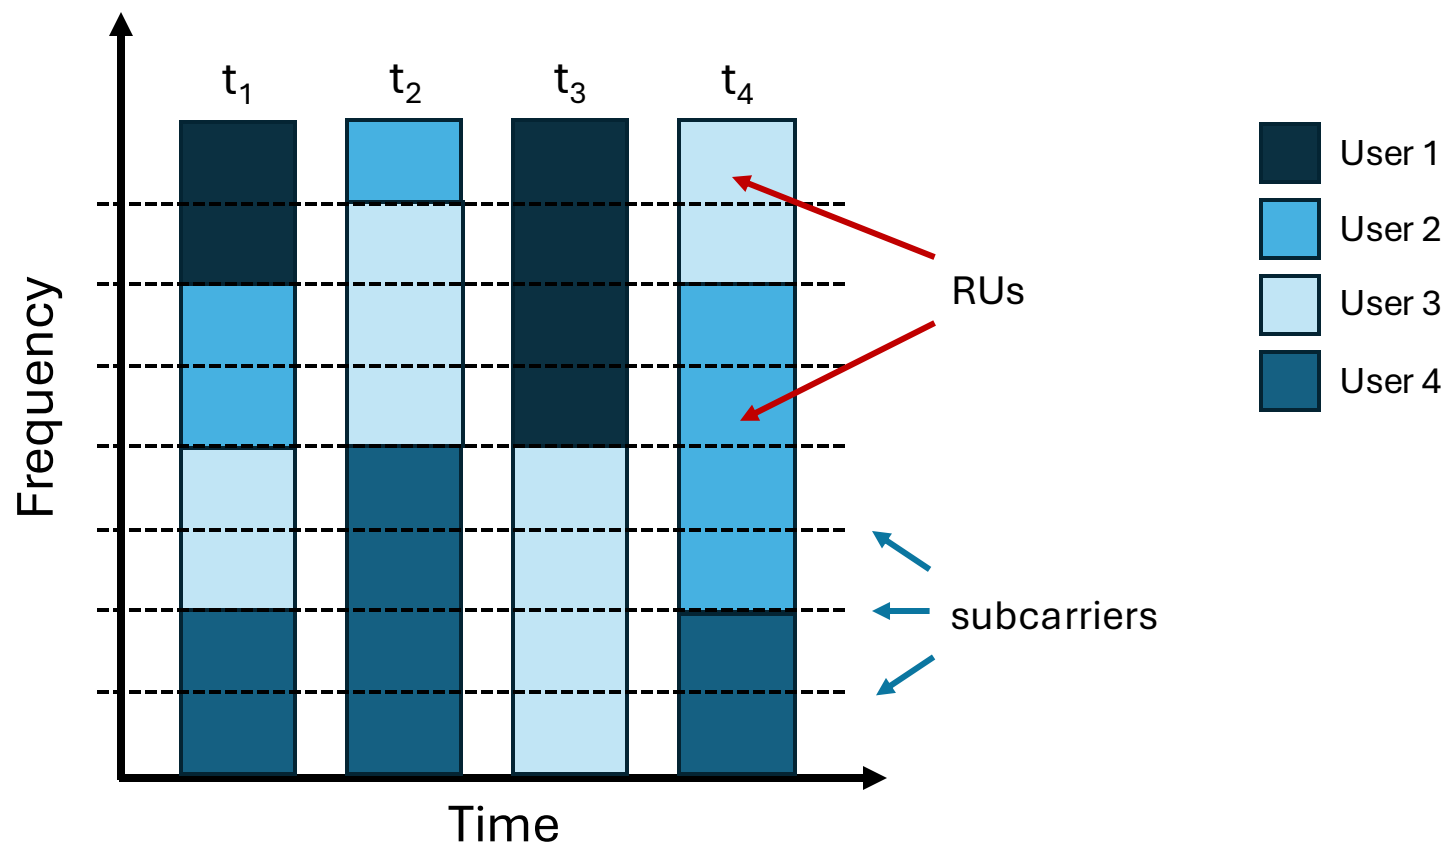

Previous standards have clients use the **entire channel** to transmit data

OFDM (Previous generations)

Previous standards have clients use the **entire channel** to transmit data

OFDMA (Wi-Fi 6)

OFDMA configures traffic for **multiple user packets per time segment**, increasing spectrum efficiency

Resource Units

RUs are the allocation blocks of bandwidth in OFDMA

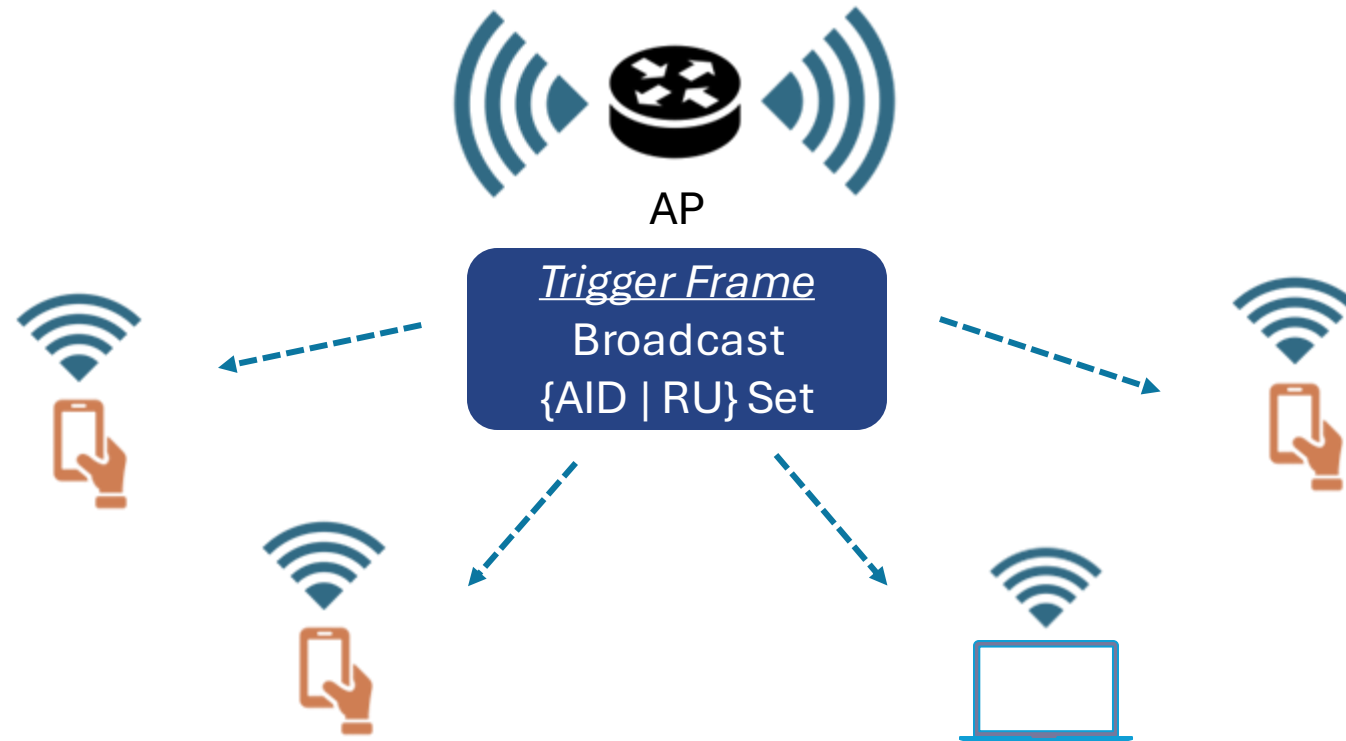

Vary in size depending on channel width

Adjacent subcarriers (*tones*) are grouped together into a resource unit (*RU*)

Assigning Bandwidths to Devices

RUs are allocated by the AP, determined by traffic demand
Trigger Frames define the RUs that devices can use

Assigning Bandwidths to Devices

Trigger Frame

IEEE 802.11 Trigger Flags:C

Type/Subtype: Trigger (0x0012)

- > Frame Control Field: 0x2400
 - .000 0001 1000 1111 = Duration: 399 microseconds
- > Receiver address: 62:fa:6f:30:d5:fd (62:fa:6f:30:d5:fd)
- > Transmitter address: ee:55:b8:1d:86:fc (ee:55:b8:1d:86:fc)
- > Common Info
- ✓ User Info
 - ✓ User Info: 0x2800182005
 - 0000 0000 0101 = AID12: 0x005
 - 0 = RU Allocation Region: Not used for 20, 40 or...
 - 1000 001. = RU Allocation: 65 (484 tones)
 - 1 = UL FEC Coding Type: LDPC
 - 0 000. = UL MCS: 0x0
 - 0. = UL DCM: False
 - 0 00. = Starting Spatial Stream: 1
 - 000. = Number Of Spatial Streams: 1
 - .010 1000 = UL Target RSSI: -70dBm
 - 0... = Reserved: 0x0

AID: Association ID of Client

ID of RU with tones

Spatial streams assigned to use
(Number of antennas needed)

Transmission Time Utilization

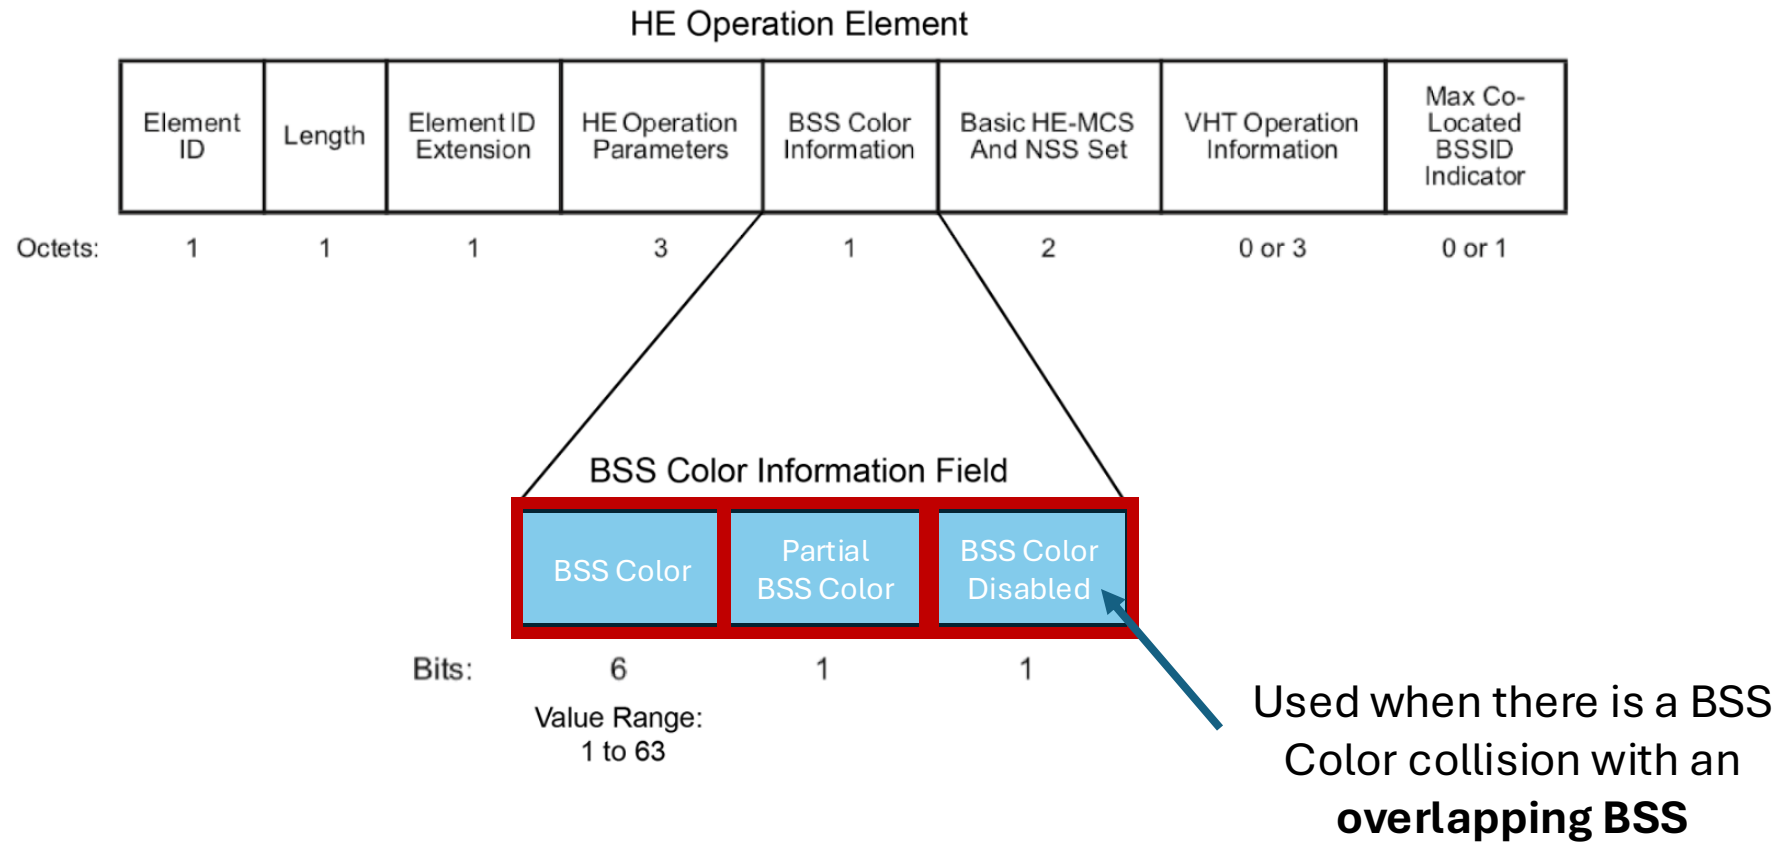

BSS Coloring

Reduces interference from nearby APs

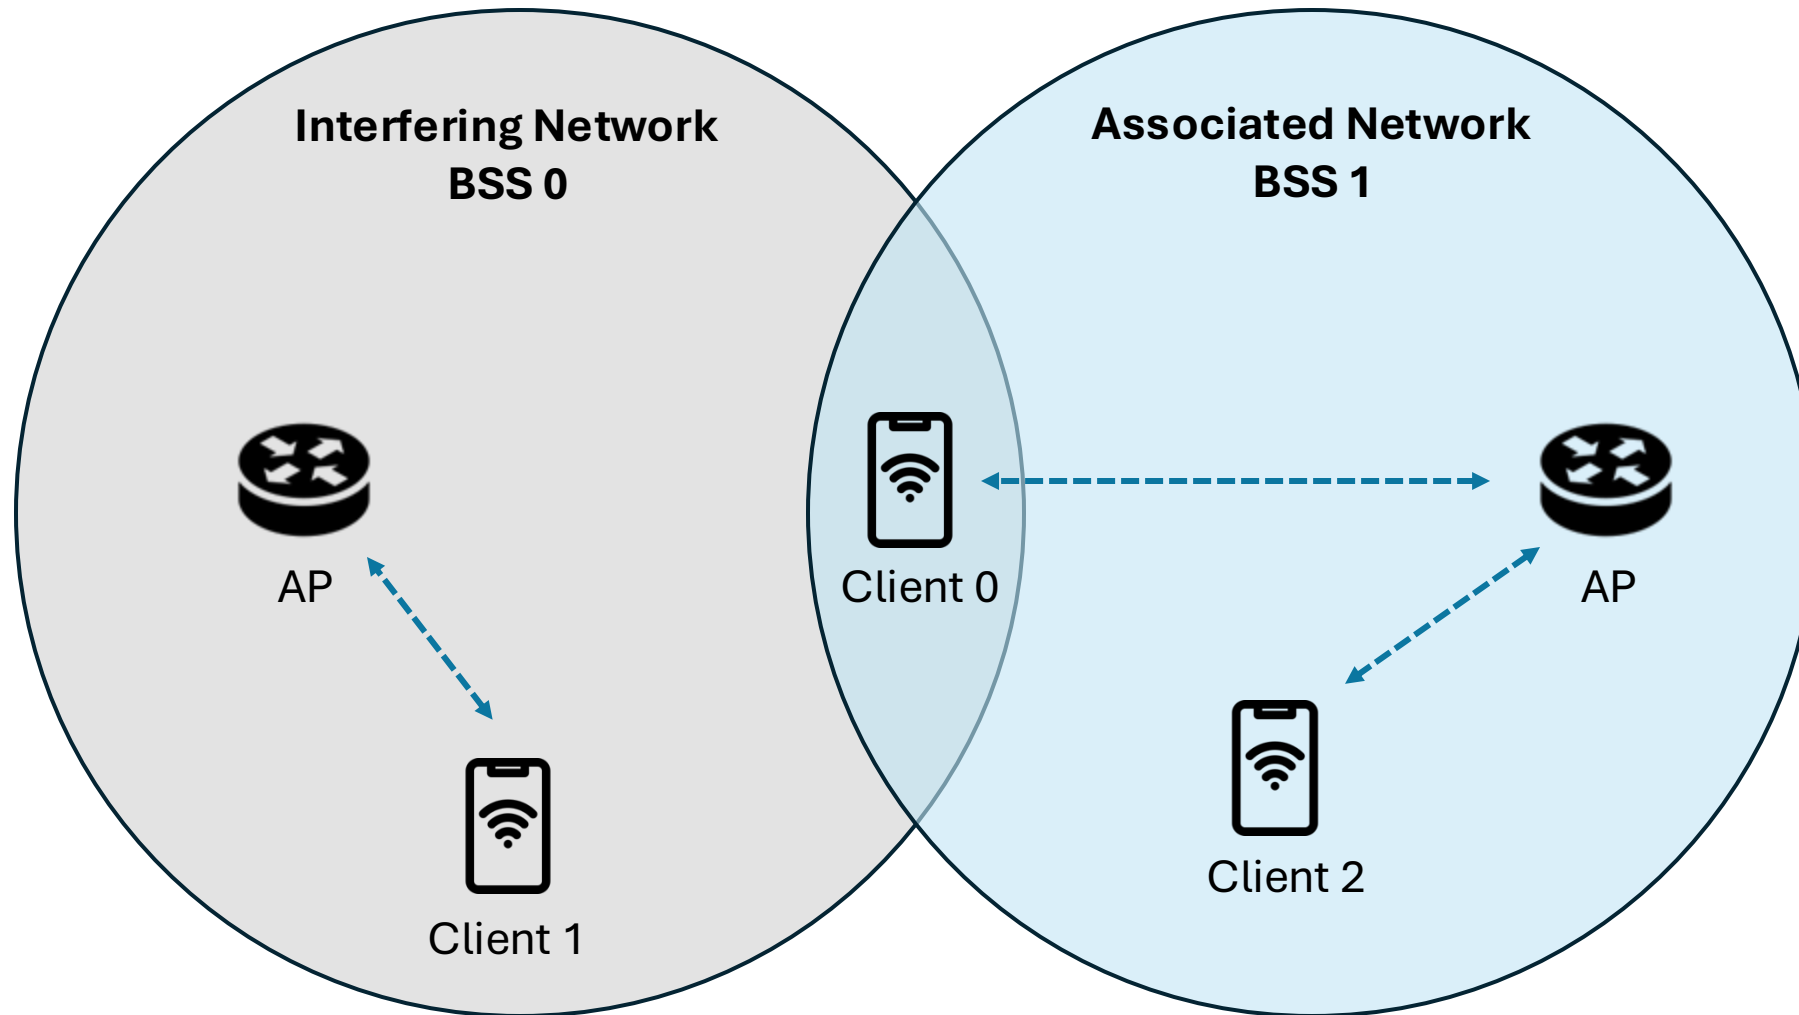

Improves coexistence between multiple APs

BSS Coloring

BSS Coloring Example

In range of
interfering AP
signal, so
check
preamble bits

BSS Coloring Example

In range of
interfering AP
signal, so
check
preamble bits

BSS Coloring Example

Problem!
Both BSS
networks use the
same color, a
color collision

BSS Coloring Example

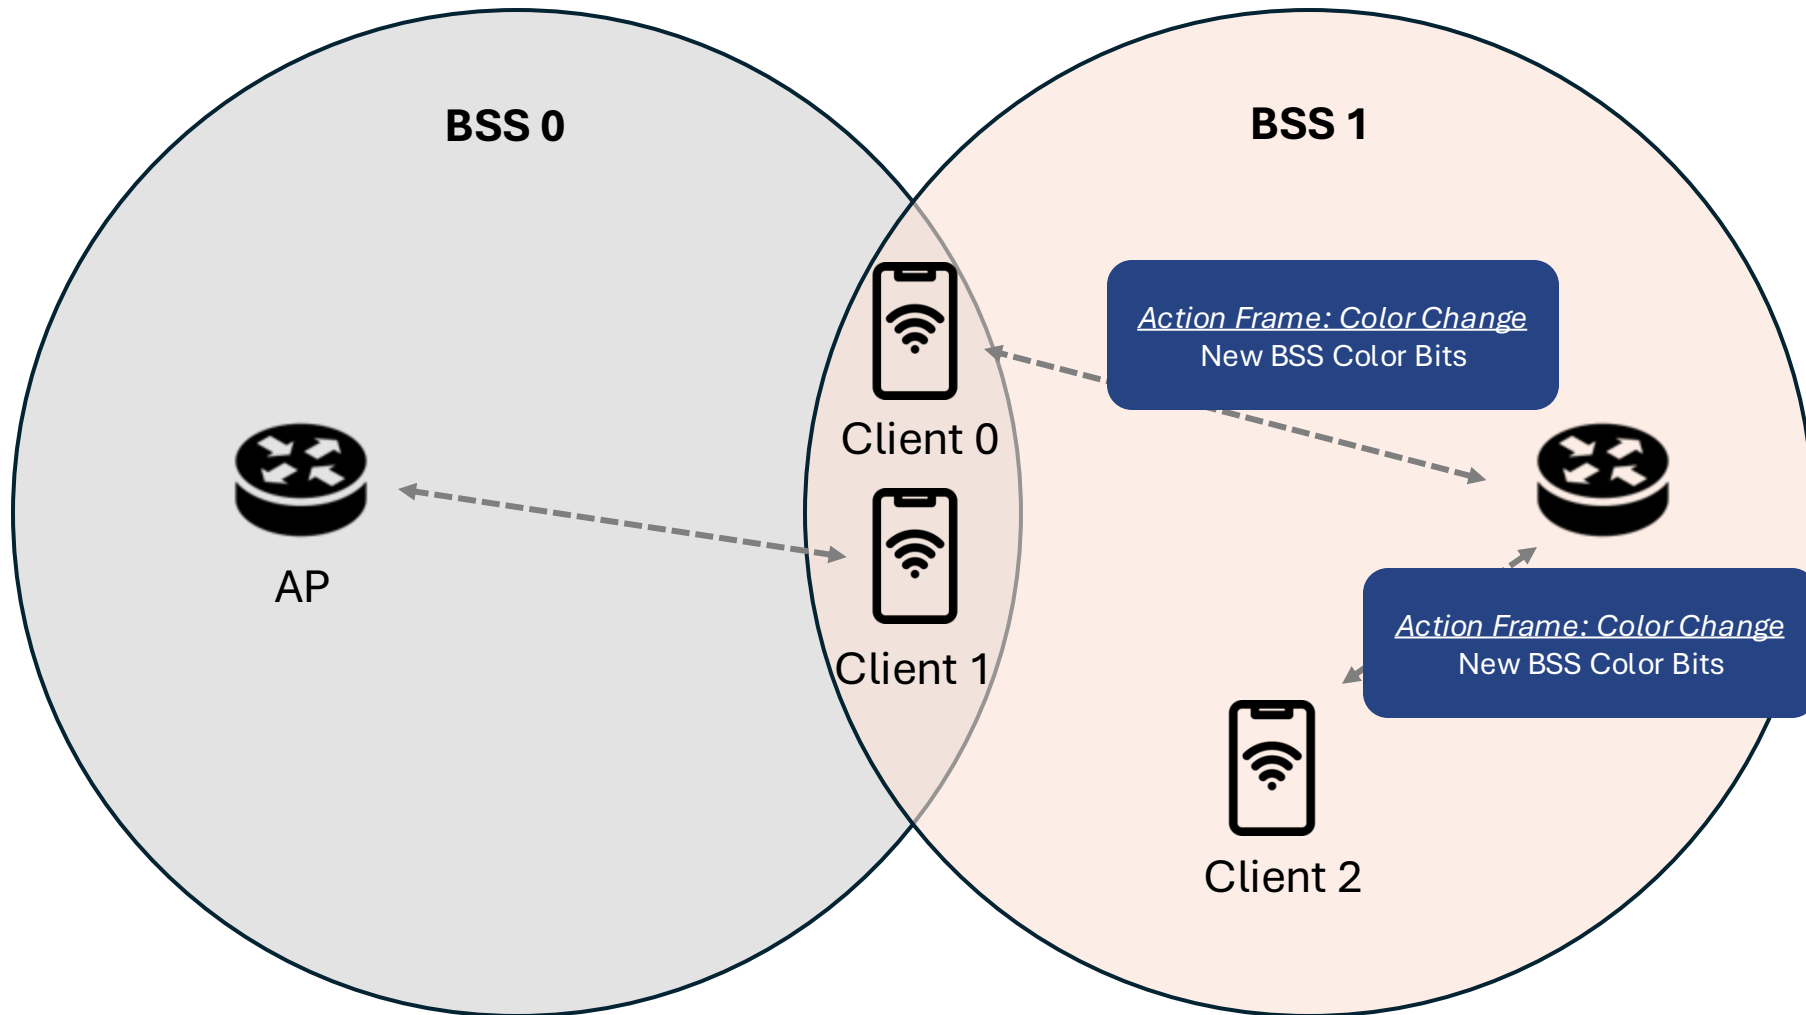

Problem!

Both BSS networks use the same color, a **color collision**

Solution:

Turn off the color, but **fall back to legacy medium access**

BSS Coloring Example

Problem!

Both BSS networks use the same color, a **color collision**

Better Solution:

Use a **Color Change Announcement**

BSS Coloring Example

Problem!

Both BSS networks use the same color, a **color collision**

Better Solution:

Use a **Color Change Announcement**

MU-MIMO Enhancements

- Increased from 4x4 (Rx:Tx antennas) in Wi-Fi 5 to 8x8 in Wi-Fi 6
- Supports simultaneous communication with multiple devices
- Enables both uplink and downlink MU-MIMO

Modulation Enhancements

Modulation Enhancements

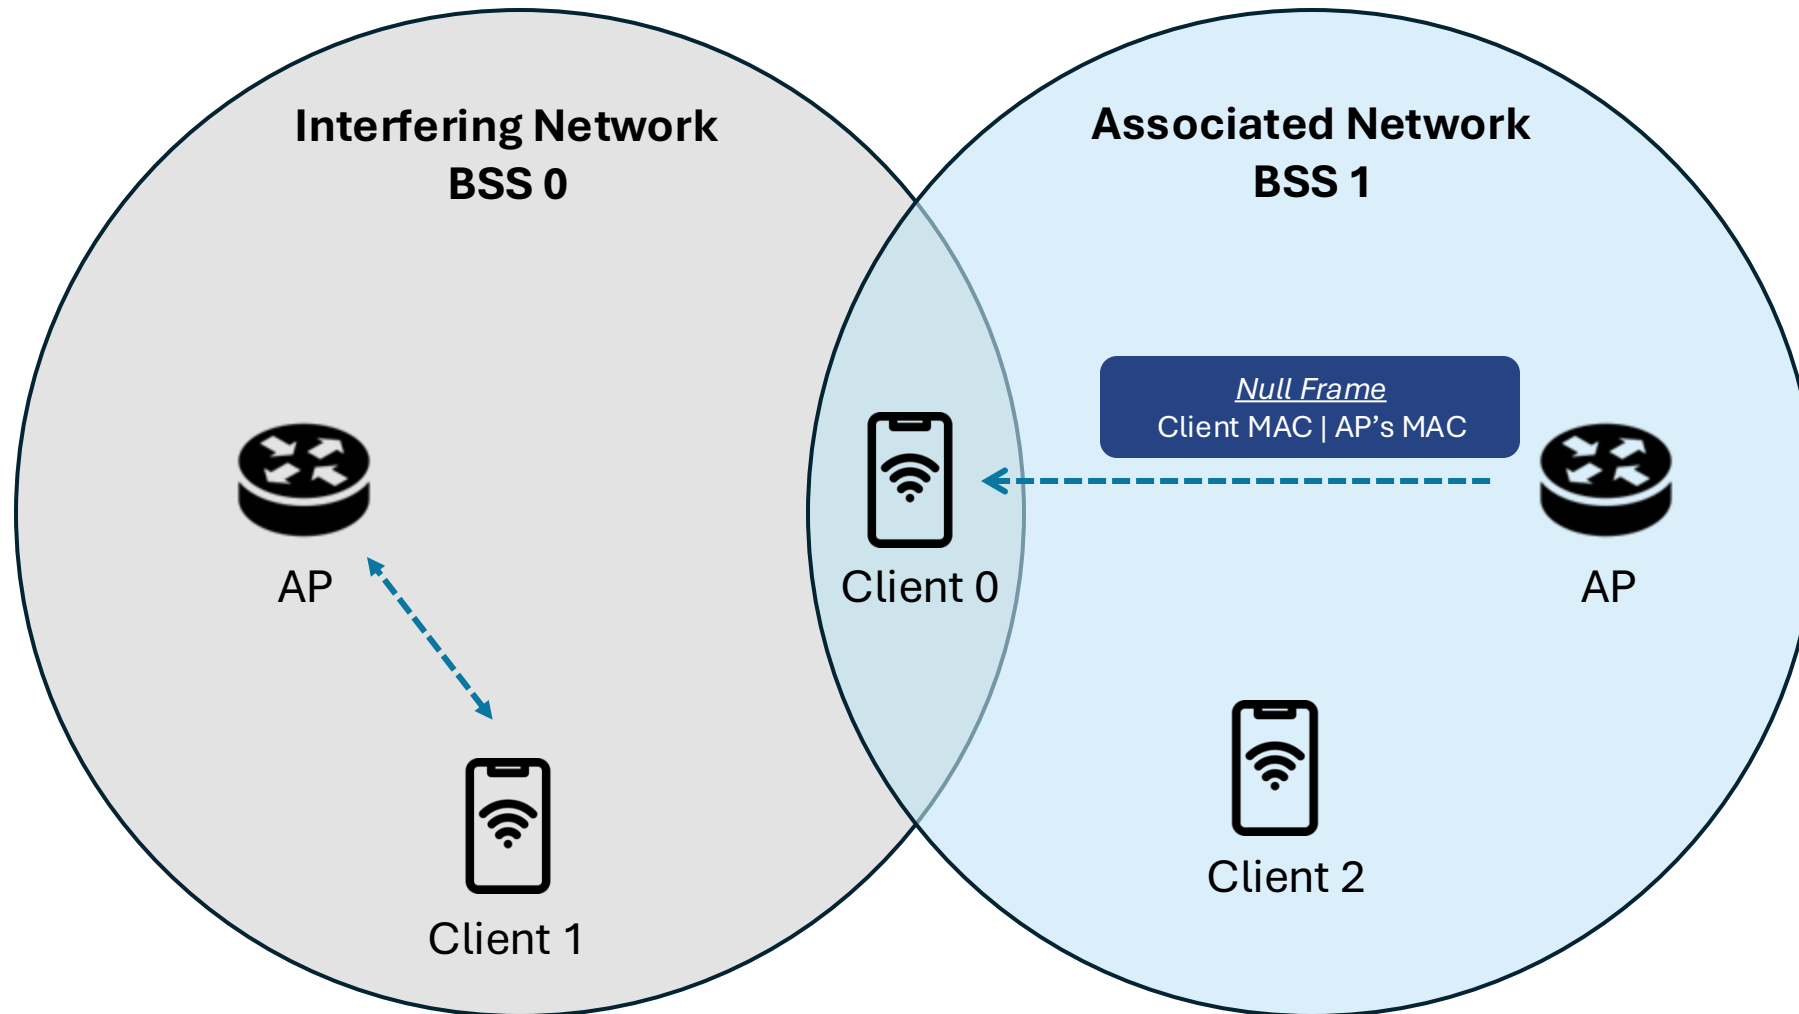

25% higher capacity per symbol

Beamforming

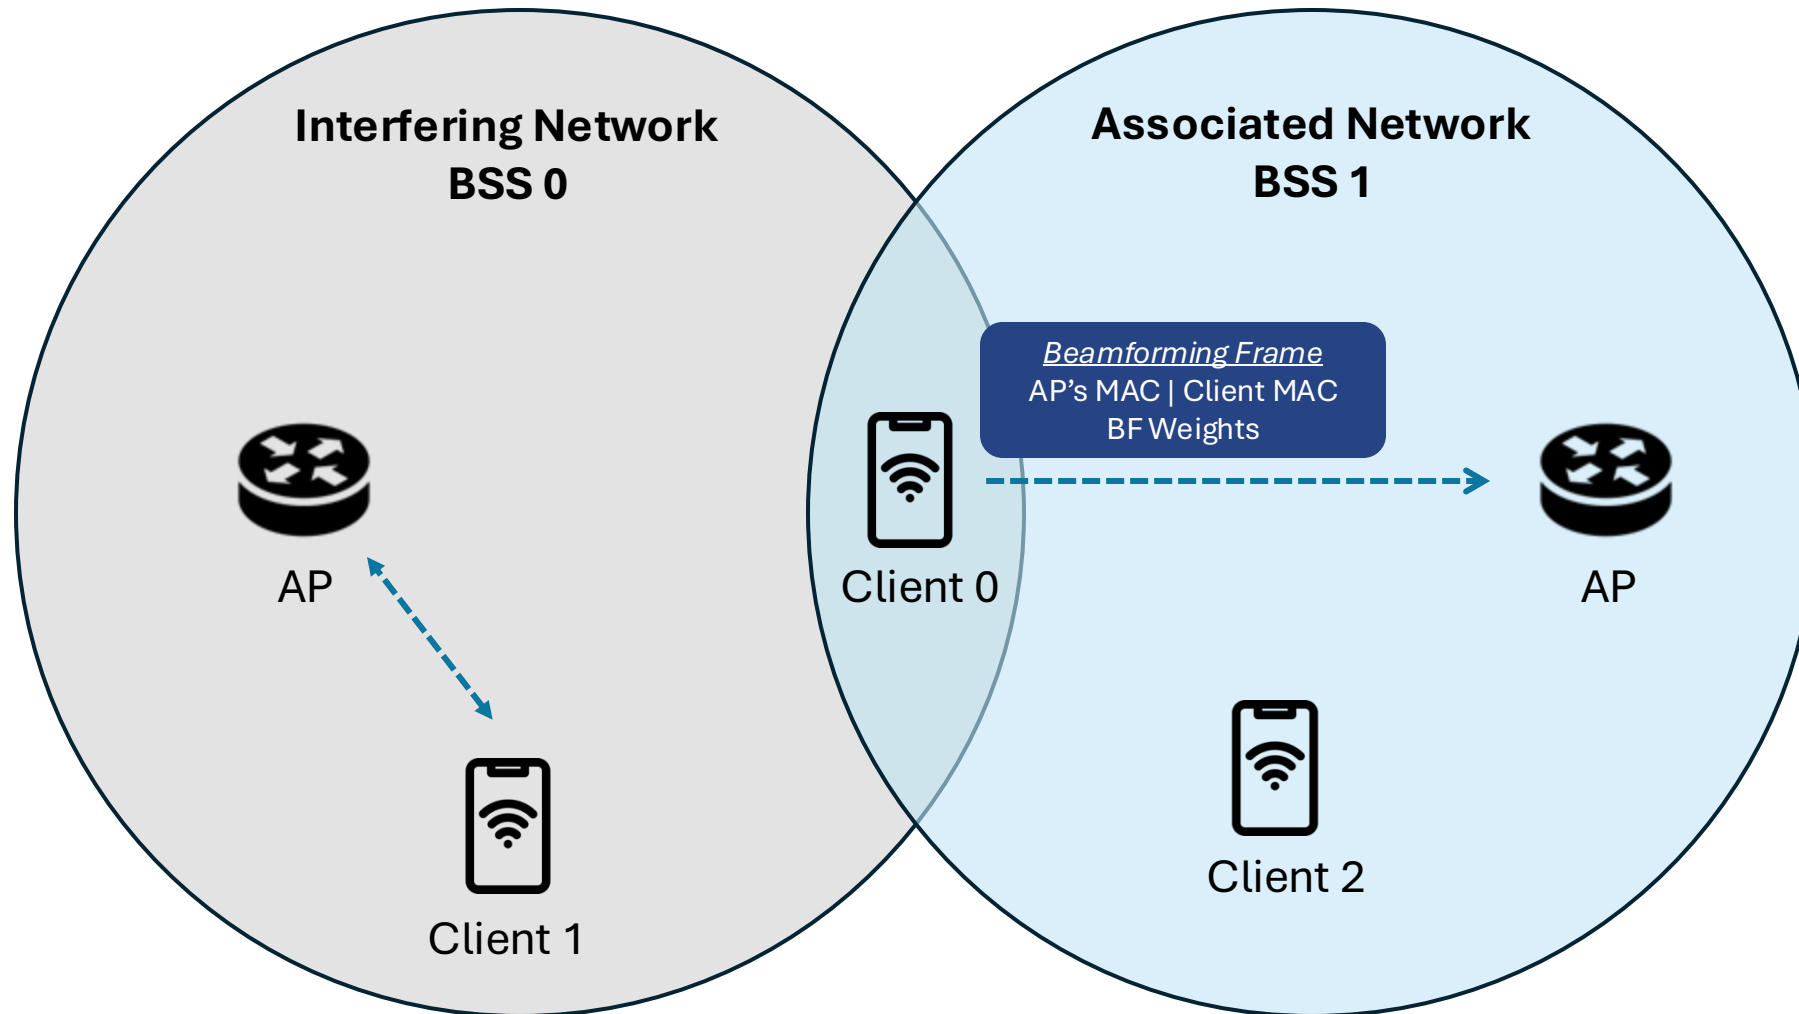

- Enables dynamic adjustment of the wireless signal direction
- Minimizes interference from nearby networks using BSS coloring

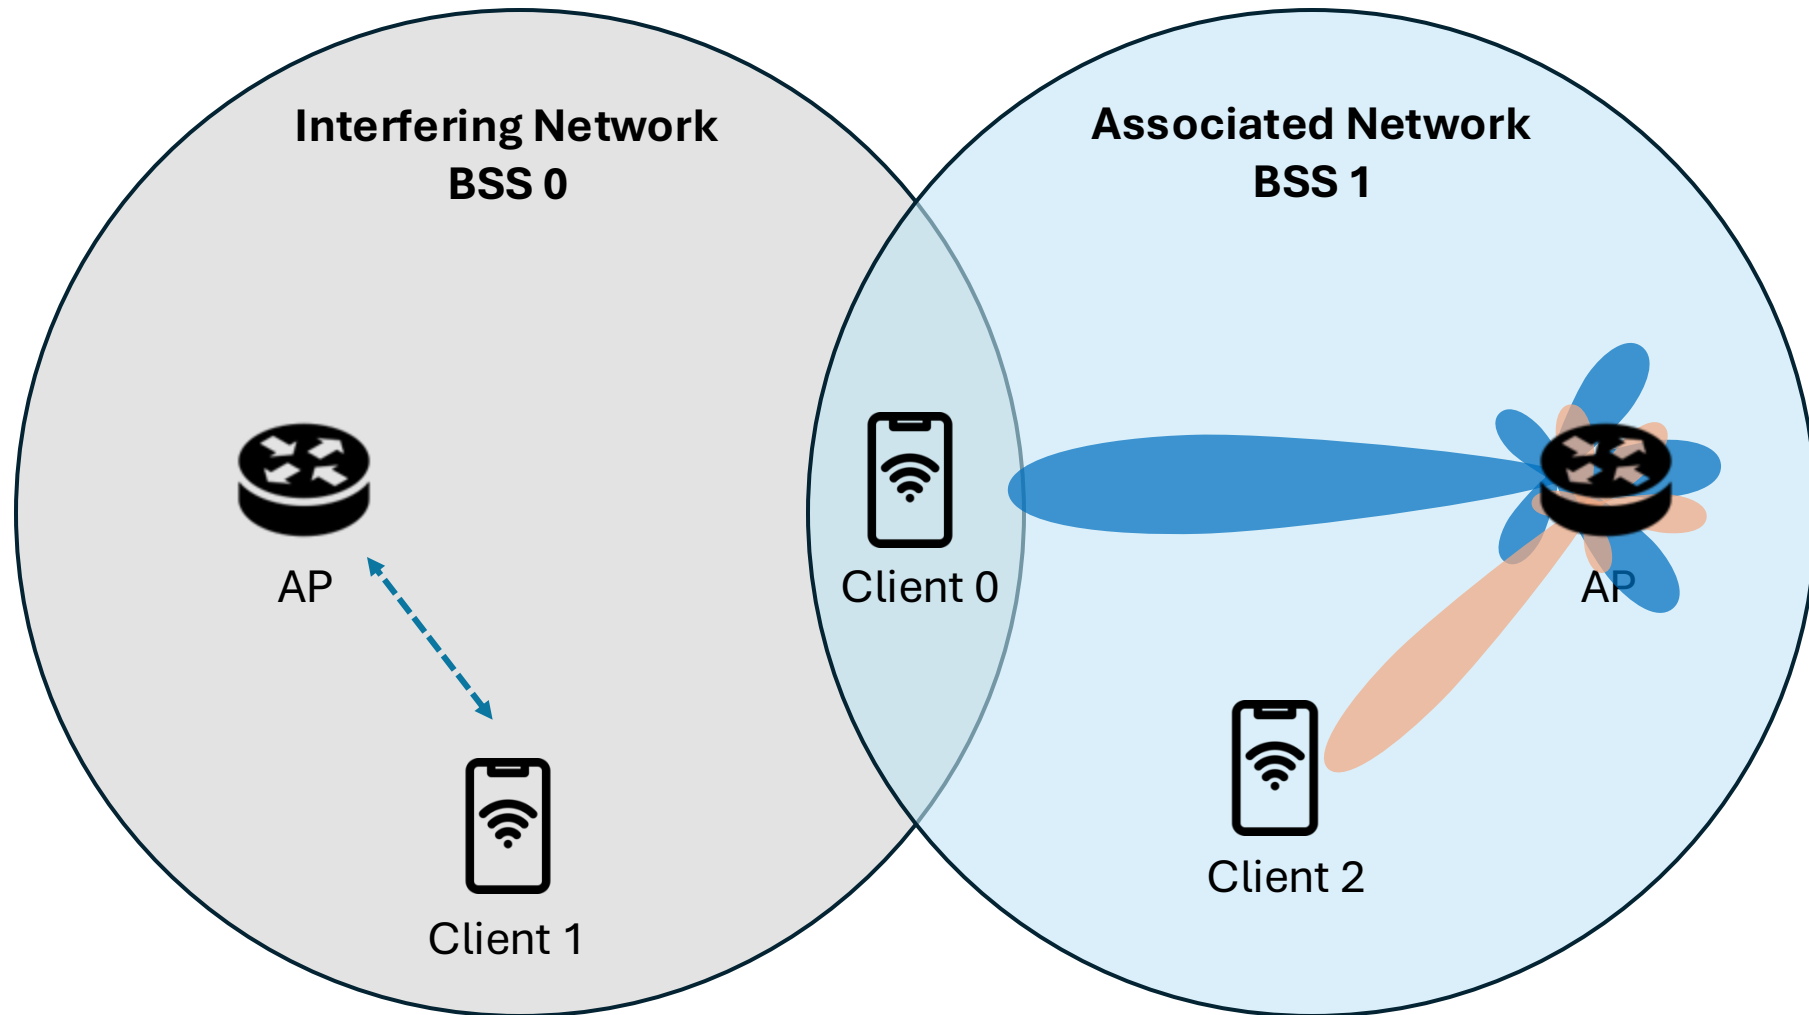

Beamforming Example

Beamforming Example

Beamforming Example

Beamforming optimizes signal strength and throughput

Wi-Fi 6E: Expanding to 6 GHz

- Introduces a new 6 GHz band
- Provides additional 1,200 MHz of bandwidth
- Allows for faster data rates and lower latency
- Offers more channels, reducing congestion in high-density areas

Wi-Fi 6E

That wraps up Wi-Fi 6!
