Digital Signal

Analog Signal

Binary Voltage Encoding

- ▶ **Common binary voltage encodings**
 - ▶ Non-return to zero (NRZ)
 - ▶ NRZ inverted (NRZI)
 - ▶ Manchester (used by IEEE 802.3—10 Mbps Ethernet)
 - ▶ 4B/5B

Non-Return to Zero (NRZ)

▶ Signal to Data

- ▶ High $\Rightarrow$ 1
- ▶ Low $\Rightarrow$ 0

▶ Comments

- ▶ Transitions maintain clock synchronization
- ▶ Long strings of 0s confused with no signal
- ▶ Long strings of 1s causes baseline wander
- ▶ Both inhibit clock recovery

Non-Return to Zero Inverted (NRZI)

► Signal to Data

- Transition $\Rightarrow$ 1
- Maintain $\Rightarrow$ 0

► Comments

- Solves series of 1s, but not 0s

Manchester Encoding

► Signal to Data

- XOR NRZ data with clock
- High to low transition $\Rightarrow$ 1
- Low to high transition $\Rightarrow$ 0

► Comments

- (used by IEEE 802.3—10 Mbps Ethernet)
- Solves clock recovery problem
- Only 50% efficient ($\frac{1}{2}$ bit per transition)

4B/5B

- ▶ **Signal to Data**

- ▶ Encode every 4 consecutive bits as a 5 bit symbol

- ▶ **Symbols**

- ▶ At most 1 leading 0
 - ▶ At most 2 trailing 0s
 - ▶ Never more than 3 consecutive 0s
 - ▶ Transmit with NRZI

- ▶ **Comments**

- ▶ 16 of 32 possible codes used for data
 - ▶ At least two transitions for each code
 - ▶ 80% efficient

4B/5B – Data Symbols

At most 1 leading 0

▶ 0000	⇒	11110
▶ 0001	⇒	01001
▶ 0010	⇒	10100
▶ 0011	⇒	10101
▶ 0100	⇒	01010
▶ 0101	⇒	01011
▶ 0110	⇒	01110
▶ 0111	⇒	01111

At most 2 trailing 0s

■ 1000	⇒	10010
■ 1001	⇒	10011
■ 1010	⇒	10110
■ 1011	⇒	10111
■ 1100	⇒	11010
■ 1101	⇒	11011
■ 1110	⇒	11100
■ 1111	⇒	11101

4B/5B – Control Symbols

- ▶ 11111 $\Rightarrow$ idle
- ▶ 11000 $\Rightarrow$ start of stream 1
- ▶ 10001 $\Rightarrow$ start of stream 2
- ▶ 01101 $\Rightarrow$ end of stream 1
- ▶ 00111 $\Rightarrow$ end of stream 2
- ▶ 00100 $\Rightarrow$ transmit error
- ▶ Other $\Rightarrow$ invalid

Basic Modulation Techniques

- ▶ Encode digital data in an analog signal

- ▶ Amplitude-shift keying (ASK)
 - ▶ Amplitude difference of carrier frequency
- ▶ Frequency-shift keying (FSK)
 - ▶ Frequency difference near carrier frequency
- ▶ Phase-shift keying (PSK)
 - ▶ Phase of carrier signal shifted

Amplitude-Shift Keying

- ▶ **Binary digit (1)**
 - ▶ Represented by presence of carrier, at constant amplitude
- ▶ **Binary digit (0)**
 - ▶ Represented by absence of carrier

$$s(t) = \begin{cases} A \cos(2\pi f_c t) & \text{binary 1} \\ 0 & \text{binary 0} \end{cases}$$

- ▶ where the carrier signal is $A \cos(2\pi f_c t)$

Amplitude-Shift Keying

- ▶ **Binary digit (1)**
 - ▶ Represented by presence of carrier, at constant amplitude
- ▶ **Binary digit (0)**
 - ▶ Represented by absence of carrier

$$s(t) = \begin{cases} A \cos(2\pi f_c t) & \text{binary 1} \\ 0 & \text{binary 0} \end{cases}$$

- ▶ where the carrier signal is $A \cos(2\pi f_c t)$
- ▶ **Inefficiencies**
 - ▶ Sudden gain changes
 - ▶ Only used when bandwidth is not a concern, e.g. on voice lines (< 1200 bps) or on digital fiber

Binary Frequency-Shift Keying (BFSK)

- ▶ **Binary digits (0 and 1)**
 - ▶ Represented by two different frequencies near the carrier frequency

$$s(t) = \begin{cases} A \cos(2\pi f_1 t) & \text{binary 1} \\ A \cos(2\pi f_2 t) & \text{binary 0} \end{cases}$$

- ▶ where f_1 and f_2 are offset from carrier frequency f_c by equal but opposite amounts

Binary Frequency-Shift Keying (BFSK)

Binary Frequency-Shift Keying (BFSK)

- ▶ **Binary digits (0 and 1)**
 - ▶ Represented by two different frequencies near the carrier frequency

$$s(t) = \begin{cases} A \cos(2\pi f_1 t) & \text{binary 1} \\ A \cos(2\pi f_2 t) & \text{binary 0} \end{cases}$$

- ▶ where f_1 and f_2 are offset from carrier frequency f_c by equal but opposite amounts
- ▶ **Less susceptible to error than ASK**
- ▶ **Sometimes used for radio (3 to 30 MHz) or coax**
- ▶ **Demodulator looks for power around f_1 and f_2**

Multiple Frequency-Shift Keying (MFSK)

- ▶ More than two frequencies are used
 - ▶ More bandwidth efficient but more susceptible to error

$$s_i(t) = A \cos 2\pi f_i t \quad 1 \leq i \leq M$$

- ▶ $f_i = f_c + (2i - 1 - M)f_d$
- ▶ f_c = the carrier frequency
- ▶ f_d = the difference frequency
- ▶ M = number of different signal elements = 2^L
- ▶ L = number of bits per signal element

Multiple Frequency-Shift Keying (MFSK)

- ▶ More than two frequencies are used
 - ▶ More bandwidth efficient but more susceptible to error
- ▶ Each symbol represents L bits
 - ▶ Symbol length is $T_s = LT$ seconds, where T is the bit period

Phase-Shift Keying (PSK)

► Two-level PSK (BPSK)

- Uses two phases to represent binary digits

$$s(t) = \begin{cases} A \cos(2\pi f_c t) & \text{binary 1} \\ A \cos(2\pi f_c t + \pi) & \text{binary 0} \end{cases}$$

$$= \begin{cases} A \cos(2\pi f_c t) & \text{binary 1} \\ -A \cos(2\pi f_c t) & \text{binary 0} \end{cases}$$

Phase-Shift Keying (PSK)

► Differential PSK (DPSK)

► Phase shift with reference to previous bit

► Binary 0

- Signal of same phase as previous signal burst

► Binary 1

- Signal of opposite phase to previous signal burst

Phase-Shift Keying (PSK)

► Four-level PSK (QPSK)

- Each element represents more than one bit
- Ex. Phase shift of multiples of 2π (90°)

$$s(t) = \begin{cases} A \cos\left(2\pi f_c t + \frac{\pi}{4}\right) & 11 \\ A \cos\left(2\pi f_c t + \frac{3\pi}{4}\right) & 01 \\ A \cos\left(2\pi f_c t - \frac{3\pi}{4}\right) & 00 \\ A \cos\left(2\pi f_c t - \frac{\pi}{4}\right) & 10 \end{cases}$$

Phase-Shift Keying (PSK)

- ▶ **Four-level PSK (QPSK)**
 - ▶ Each element represents more than one bit
 - ▶ Ex. Phase shift of multiples of 2π (90°)

Phase-Shift Keying (PSK)

▶ Multilevel PSK

- ▶ Each angle has more than one amplitude
- ▶ Multiple signals elements

$$D = \frac{R}{L} = \frac{R}{\log_2 M}$$

- ▶ D = modulation rate, baud
- ▶ R = data rate, bps
- ▶ M = number of different signal elements = 2^L
- ▶ L = number of bits per signal element

Phase-Shift Keying (PSK)

- ▶ Send carrier frequency for one period
 - ▶ Perform phase shift
 - ▶ Shift value encodes symbol
 - ▶ Value in range $[0, 360^\circ)$
 - ▶ Multiple values for multiple symbols
 - ▶ Represent as circle

8-symbol
example

Quadrature Amplitude Modulation (QAM)

16-symbol example

- ▶ Uses a combination of amplitude and phase modulation
 - ▶ Sends one of N signals each clock cycle
- ▶ Each transition represents a symbol
 - ▶ Transmission rate = symbols per second
- ▶ Each symbol contains multiple bits
 - ▶ Ex. 16 QAM: $\log_2 16 = 4$ bits
- ▶ Points in constellation diagram
 - ▶ Chosen to maximize error detection

Quadrature Amplitude Modulation (QAM)

- ▶ **QAM uses two-dimensional signaling**
 - ▶ ASK and PSK
 - ▶ A_k modulates in-phase $\cos(2\pi f_c t)$
 - ▶ B_k modulates quadrature phase $\sin(2\pi f_c t)$

$$s(t) = A_k(t) \cos 2\pi f_c t + B_k(t) \sin 2\pi f_c t$$

Signal Constellations

- ▶ Each pair defines a point in the plane
- ▶ Signal constellation set of signaling points

2 possible points per T sec.
1 bit / pulse

4 possible points per T sec.
2 bits / pulse

Other Signal Constellations

► Different options for 16 QAM

QAM & Wi-Fi Generations

- Wi-Fi 2 & 4 (802.11a & n)
 - Max 64-QAM
 - 6 bits per symbol
- Wi-Fi 5 (802.11ac)
 - Max 256-QAM
 - 8 bits per symbol
- Wi-Fi 6 / 6E (802.11ax)
 - Max 1024-QAM
 - 10 bits per symbol
- Wi-Fi 7 (802.11be)
 - Max 4096-QAM
 - 12 bits per symbol

Adapting to Channel Conditions

- ▶ Channel conditions vary
 - ▶ Physical environment of the channel
 - ▶ Changes over time (slow and fast fading)
- ▶ Modulation schemes are only as good as the receiver's ability to differentiate the symbols!

We'll deal with this when
we discuss errors

Adapting to Channel Conditions

- ▶ Fixed coding/modulation scheme will often be inefficient
 - ▶ Too conservative for good channels
 - ▶ Too aggressive for bad channels
- ▶ Adjust coding/modulation based on channel conditions – “rate” adaptation
 - ▶ Controlled by the MAC protocol
 - ▶ E.g. 802.11a: BPSK – QPSK – 16-QAM – 64 QAM

Using Modulation: Backscatter

- ▶ Consider a flashlight emitting a beam of light
- ▶ The light is reflected by the mirror
- ▶ The intensity of the reflected beam can be associated with a logical “0” or “1”

Using Modulation: Backscatter

- ▶ **Switch open**
 - ▶ Absorbs the wave
 - ▶ Nothing bounces back
 - ▶ Bit = 0
- ▶ **Switch closed**
 - ▶ Reflects the wave back
 - ▶ Bit = 1

Backscatter Communication: RFID

- ▶ RFID tag **reflects** or **absorbs** the reader's carrier wave

Passive RFID: Two Different Physical Mechanisms

▶ LF/HF: Inductive Coupling

- ▶ Reader coil generates a magnetic field
- ▶ Tag coil harvests power via mutual inductance (near-field)
- ▶ Tag must sit inside the near-field zone
- ▶ Range: < 1 cm
- ▶ Data rate: bps to few kbps
- ▶ Example: NFC tap-to-pay

▶ UHF: RF Backscatter

- ▶ Reader radiates a true propagating RF wave;
- ▶ Tag reflects it back by toggling its antenna (far-field)
- ▶ Works at real radio range, not just proximity
- ▶ Range: a few meters
- ▶ Data rate: up to 100s of kbps
- ▶ Example: RFID

Backscatter Frequency and Range

	UHF Backscatter RFID	HF Proximity RFID	NFC (Near Field)
Primary Frequency	860 MHz - 960 MHz	13.56 MHz	13.56 MHz
Typical Scan Range	Up to 12+ meters (40 feet)	Up to 1 meter (3 feet)	Under 10 centimeters (4 inches)
Data Coupling	Electromagnetic Far-Field	Inductive Near-Field	Inductive Near-Field Focus
Comms Direction	Unidirectional (Tag to Reader)	Unidirectional (Tag to Reader)	Bidirectional (Two-Way Comms)
Use Cases	Pallet tracking, bulk retail scans	Keyfob access control, library logs	Apple Pay, secure pairings, smart posters

Backscatter Communication

- ▶ Reader-to-tag
 - ▶ ON-OFF Keying
 - ▶ Pulse Interval Encoding (PIE)

Signal is on for longer time

Maximize energy harvesting at the tag

Backscatter Communication

- ▶ Tag-to-reader

- ▶ ON-OFF Keying

- ▶ FM0

- ▶ Inverts switch at every symbol

- ▶ 0 bits has extra switch mid-symbol

Backscatter Communication

- ▶ Tag-to-reader
 - ▶ ON-OFF Keying
 - ▶ Miller
 - ▶ Inverts switch between two consecutive 0 bit symbols
 - ▶ Inverts the switch in the middle of 1 bit symbol

Backscatter Communication

▶ Tag-to-reader

- ▶ ON-OFF Keying
- ▶ Miller
 - ▶ Inverts switch between two consecutive 0 bit symbols
 - ▶ Inverts the switch in the middle of 1 bit symbol

▶ Benefits

- ▶ Multiple switches per bit
- ▶ Robust to Multi-Reader, Multi-Tag scenarios
- ▶ Robust to noise
- ▶ $M=2$, Data Rate
 - ▶ 20 Kbps – 320 Kbps
- ▶ $M=4$, Data Rate
 - ▶ 10 Kbps – 160 Kbps
- ▶ $M=8$, Data Rate
 - ▶ 5 Kbps – 80 Kbps

Ultrawide Band (UWB)

- ▶ UWB sends extremely short pulses (nanoseconds), spreading energy across a huge bandwidth (500+ MHz, often several GHz)

Ultrawide Band (UWB)

- ▶ Energy is spread across spectrum
 - ▶ Transmit power density stays very low
 - ▶ FCC lets UWB share spectrum used by other services

Ultrawide Band (UWB)

- ▶ **Precise timing enable PPM (Pulse Position Modulation)**
 - ▶ Pulses are narrow and identical
 - ▶ Transmitter uses very steady, low power.
 - ▶ Amplitude noise does not corrupt the message
 - ▶ Data relies only on timing, not height.
 - ▶ Receiver must match the sender's clock precisely

Ultrawide Band (UWB)

► Precise timing enable PPM (Pulse Position Modulation)

Ultra-Wideband (UWB)

- ▶ The huge bandwidth gives extremely fine time resolution
 - ▶ Individual multipath reflections arrive far enough apart in time to be resolved separately
 - ▶ No equalizer needed to fight ISI
 - ▶ Time-of-flight can be measured to centimeter-level accuracy
 - ▶ UWB is primarily a precision ranging/localization technology
- ▶ Short range (tens of meters)

Wireless Spectrum: What's Missing?

Wireless Spectrum: Light!

- ▶ 10,000 times larger than the entire radiofrequency spectrum
- ▶ Can we send data through visible light waves?

Early Visible Light Communication

- ▶ Flashes of a lamp
 - ▶ Morse Code
 - ▶ Used by ships to communicate over long distances

A - ·	N - · ·	1 - · · · · ·

K - · · · ·	X - · · · ·	
L - · · · ·	Y - · · · · ·	SOS
M - · · ·	Z - · · · · ·	· · · · ·

Early Visible Light Communication

- ▶ Flashes of a lamp
 - ▶ Morse Code
 - ▶ Used by ships to communicate over long distances
- ▶ Limitations
 - ▶ Human operators
 - ▶ Low data rate
 - ▶ Weather affects reliability
 - ▶ Light doesn't pass through walls
 - ▶ A natural security and interference boundary, but also a coverage limitation

VLC Transmitter: Light Emitting Diode (LED)

▶ Diode

- ▶ One-way switch for electric current
- ▶ LED emits light when current passes through

- ▶ A photodiode receiver detects the intensity changes and recovers the bitstream

VLC Modulation

▶ On-Off Keying

- ▶ 1: turn on the LED
- ▶ 0: turn off the LED

VLC Modulation

▶ On-Off Keying

- ▶ 1: turn on the LED
- ▶ 0: turn off the LED

- ▶ Flickering
- ▶ Transitions must be faster than the human eye can perceive

VLC: Tradeoffs vs. RF

► Advantages

- No RF interference
 - Safe for hospitals, aircraft, and RF-sensitive environments
- Inherent physical security
 - signal is contained to a lit room
- Can piggyback on existing LED lighting infrastructure

► Limitations

- Requires line-of-sight
 - Blocked by obstacles
 - Doesn't work in the dark or through walls
- Uplink is awkward
 - Needs a return path (often RF or infrared)
 - Ambient light usually isn't attacker-free
- Mobility and multi-user access are open problems
