

2.24/2.2

- Method of conditional expectations
- Martingales.

$f(X_1, X_2, \dots, X_n)$

$X_1, X_2, \dots, X_n \in \{0, 1\}$

F 3SAT formula n variables

$f(X_1, \dots, X_n) = \# \text{ of clauses in } F \text{ that are satisfied by this assignment.}$

$$\mathbb{E}f = \mathbb{E}[f(X_1, X_2, \dots, X_n)] = \frac{7}{8}m.$$

$$X_{17} \vee X_{13} \vee X_{22} \quad k=3$$

$$P[\text{clause with } k \text{ variables} \rightarrow \text{satisfied}] = 1 - \frac{1}{2^k}$$

m clauses in $F \Rightarrow$ in expectation $\# \text{ of satisfied clauses}$

clauses in random assignment is $\frac{7}{8}m$.

How to derandomize

$$\mathbb{E}f(v_1, \dots, v_k) = \mathbb{E}[f(X_1, X_2, \dots, X_n) \mid X_1=v_1, X_2=v_2, \dots, X_k=v_k]$$

$$\begin{array}{c} x_7 \\ \downarrow \\ v_7 \end{array} \quad \begin{array}{c} x_9 \\ \downarrow \\ v_9 \end{array}$$

$$\underbrace{(1 \vee \neg m)}_{1} \quad \underbrace{(0 \vee \overline{x_{17}} \vee x_{19})}_{(\overline{x_{17}} \vee x_9)} \quad \underbrace{\neg}_{2}$$

X_{k+1}, \dots, X_n

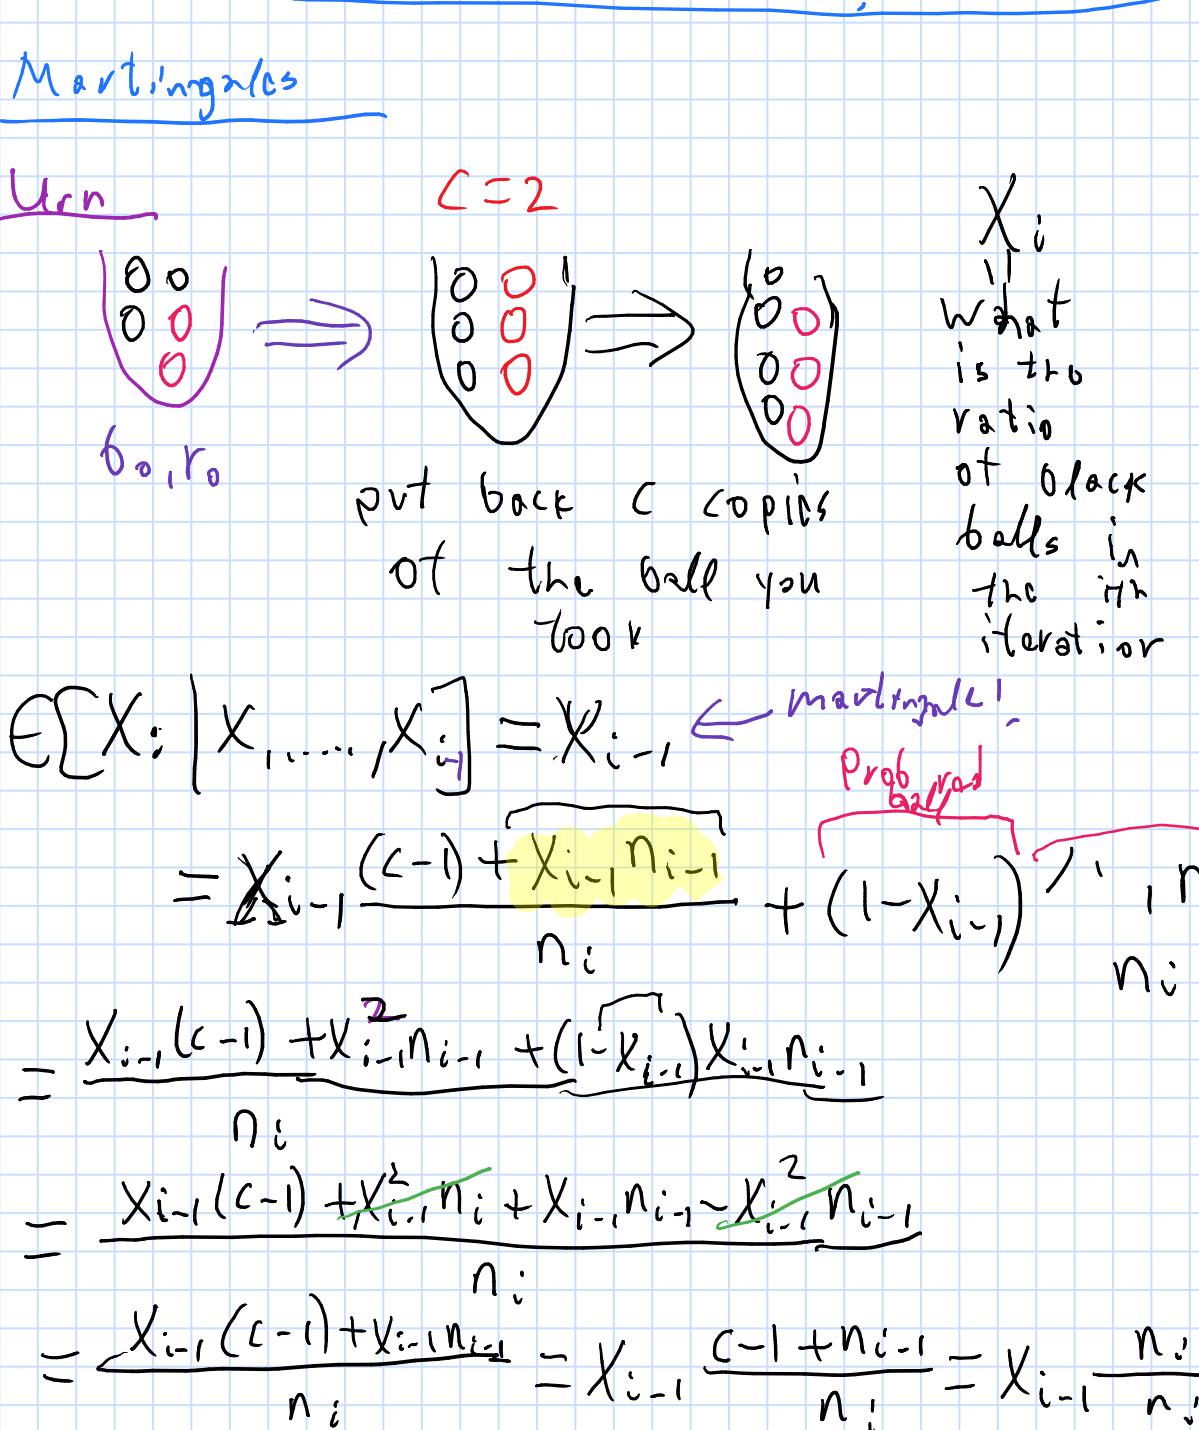

$$\begin{array}{c} \# \text{ vars} \\ 1 \\ 2 \\ \vdots \\ 7 \\ \vdots \\ 8 \end{array} \quad \begin{array}{c} 1 - 1/2 = 1/2 \\ 1 - 1/2^2 = 3/4 \\ \vdots \\ 1 - 1/2^7 = 15/16 \end{array}$$

$Z_i = 1 \Leftrightarrow i\text{th clause in } G \text{ is satisfied}$

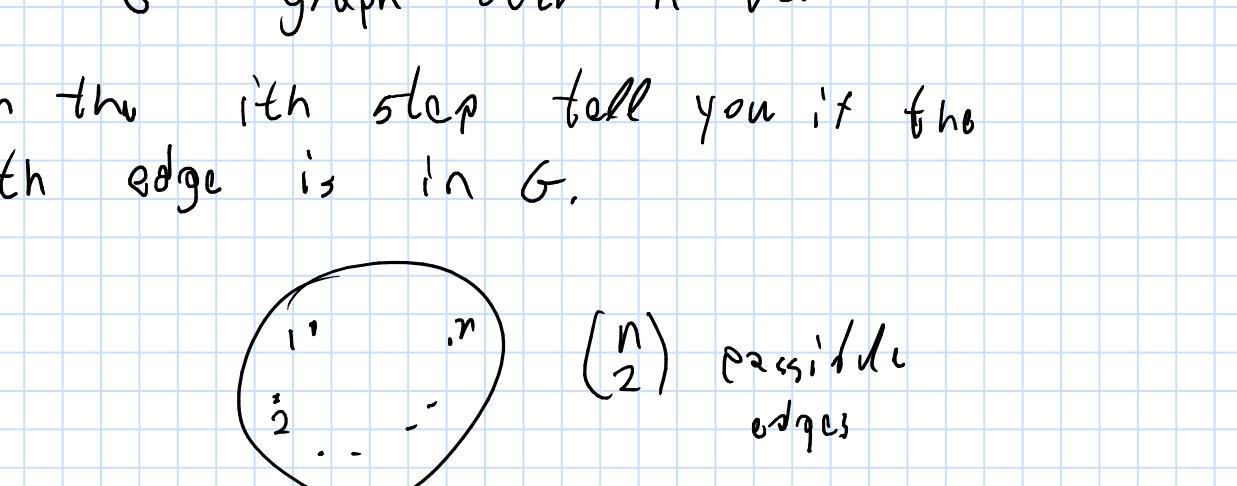

$$P[Z_i=1] = 1 - 1/2^{\# \text{ of literals in the clause}}$$

$$\mathbb{E}\left[\sum \# \text{ clauses set in } G \mid X_{k+1}, \dots, X_n\right] = \mathbb{E}\left[\sum Z_i\right] = \sum \mathbb{E}[Z_i] = \sum_i P[Z_i=1]$$

Task: Come up deterministically on assignment that satisfies at least $(7/8)m$ clauses f .

$$\alpha = \frac{\beta + \gamma}{2}$$

$$O(m) \cdot 2 \cdot O(m) = O(nm)$$

$$\mathbb{E}[f(X_1, \dots, X_n)]$$

$$\mathbb{E}[f(v_1, \dots, v_k, X_{k+1}, \dots, X_n)] \quad \text{0/1 concrete values}$$

Martingales

$X_0, X_1, X_2, \dots, X_n$

$X_i \equiv \text{amount of money after the } i\text{th round in a betting game.}$

$X_0 = 1$

B_i fraction of X_{i-1}

$$X_i = \alpha \begin{cases} (1+B_i)X_{i-1} & \text{you won} \\ (1-B_i)X_{i-1} & \text{you lost} \end{cases}$$

Such a sequence is a martingale if

$$\mathbb{E}[X_i \mid X_1, X_2, \dots, X_{i-1}] = X_{i-1}$$

In the example

$$\mathbb{E}[X_i \mid X_{i-1}] = X_{i-1}$$

$X_1, X_2, X_3, \dots, X_n$ they are not independent

$$X_n = 2^n$$

$$\mathbb{E}[X_n] = \mathbb{E}[\mathbb{E}[X_n \mid X_1, \dots, X_{n-1}]]$$

$$= \mathbb{E}[X_{n-1}]$$

\dots

$$= \mathbb{E}[X_0] = X_0$$

There is strong concentration!
