ECE 313 / MATH 362 PROBABILITY WITH ENGINEERING APPLICATIONS
LECTURE 36 : MINIMUM MEAN SQUARE ERROR ESTIMATION PART 1
   · TOPICS TO COVER (BASED ON CH 4.9)
     - CONSTANT ESTIMATORS
     > UNCONSTRAINED ESTIMATORS
   CONSTANT ESTIMATORS
     Y: A RANDOM VARIABLE WITH KNOWN PROBABILITY DISTRIBUTION F
     QUESTION : SUPPOSE Y IS NOT OBSERVED BUT WE WISH TO ESTIMATE Y
               WHAT DO YOU THINK COULD BE AN INTUITIVELY GOOD CHOICE
               OF ESTIMATOR FOR THE UNOBSERVED Y?
      ANSWER : P = EY CONSTANT
                  A NOTATION FOR AN ESTIMATOR
     WE NEXT SHOW THAT THIS INTUITIVE CHOICE IS INDEED A GOOD CHOICE IN
         SENSE THAT IT MINIMIZES SOMETHING CALLED THE MEAN SQUARE
      THE
      ERROR (MSE).
     LET 6 BE A CONSTANT THAT WE WISH TO VSE TO ESTIMATE THE RV Y
     THEN
                                              ON = Y-6

TO TREAT UNDER-

AND OVER-ESTIMATION
                                   IN ESTIMATION
                           ERROR
                 SQUARE(D) ERROR
```

MEAN SQUARE(D) ERROR IN ESTIMATION =
$$E(Y-6)^2$$

EXPECTED / AVERAGE

WE WANT TO CHOOSE 6 SUCH THAT THE MGE IS MIMIMIZED, I.E., SOLVE

$$6^* = \underset{6}{\operatorname{arg min}} \mathbb{E}(Y-6)^2$$

HOW ?

- TO DIFFERENTIATE E(Y-6)2 AND
- > SET IT EQUAL TO ZERO

CONSIDER
$$E(Y-6)^2 = E(Y^2 - 2Y6 + 6^2)$$

$$= E(Y^2) - 26E(Y) + 6^2$$
EXPECTATION

$$\Rightarrow \frac{d}{d6} E(Y-6)^2 = -2E(Y) + 26 = 0$$

$$\Rightarrow 6^* = E(Y)$$
THIS MINIMIZES THE MGE

MSE AT
$$6^{*} = E(Y)$$
 : $E(Y - 6^{*})^{2} = E(Y - E(Y))^{2} = Var(Y)$

$$E(Y-G)^{2} = E(Y-E(Y)+E(Y)-G)^{2}$$

$$= E(Y-E(Y))^{2} + E(E(Y)-G)^{2}$$

$$= Var(Y) + (E(Y)-G)^{2} + 2(E(Y)-G)) E((Y-E(Y))$$

$$= Var(Y) + (E(Y)-G)^{2} + 2(E(Y)-G)) (E(Y)-E(Y))$$

$$= Var(Y) + (E(Y)-G)^{2} + 2(E(Y)-G)) (E(Y)-E(Y))$$

$$= Var(Y) + (E(Y)-G)^{2}$$

$$= ALWAYS NON-NEGATIVE$$

$$CONSTAT WRT G$$

$$SET G = E(Y)$$

$$MINIMUM MSE CONSTANT ESTIMATOR OF Y$$

+ UNCONSTRAINED ESTIMATORS

BASED ON

Y: A RANDOM VARIABLE WITH KNOWN PROBABILITY DISTRIBUTION FX

X: A RANDOM VARIABLE WITH KNOWN PROBABILITY DISTRIBUTION FX

QUESTION: SUPPOSE Y IS NOT OBSERVED BUT X IS AND WE WISH TO

ESTIMATE Y BASED ON AN OBSERVATION FROM X.

WHAT DO YOU THINK COULD BE A INTUITIVELY 'GOOD'

CHOICE OF ESTIMATOR FOR THE UNOBSERVED Y

AN OBSERVATION FROM X ?

ANSWER : RECALL YOUR ANSWER WHEN NO OBSERVATION ON X WAS THERE.

NOW YOU HAVE AN OBSERVATION ON X. WHAT CAN YOU DO?

VPDATE THE CONSTANT ESTIMATOR P = EY WITH X AS:

 $|\hat{Y}| \times = E(Y|X) : CONDITIONAL EXPECTATION OF Y GIVEN X$

WE NEXT SHOW THAT THIS INTUITIVE CHOICE IS INDEED A GOOD CHOICE IN

THE SENSE THAT IT MINIMIZES THE MEAN SQUARE ERROR (MSE).

LET 9(X) BE A FUNCTION OF X THAT WE WISH TO VSE TO ESTIMATE THE

RV Y. THEN

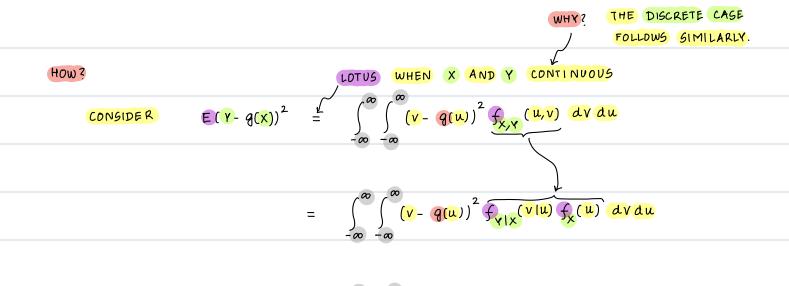

ERROR IN ESTIMATION = Y - g(x)

SQUARE(D) ERROR IN ESTIMATION = $(Y - g(x))^2$

MEAN SQUARE(D) ERROR IN ESTIMATION = $E(Y - g(x))^2$ EXPECTED / AVERAGE

WE WANT TO CHOOSE 6 SUCH THAT THE MSE IS MIMIMIZED, I.E., SOLVE

$$q^*(x) = \underset{q(x)}{\operatorname{arg min}} \mathbb{E}(Y - q(x))^2$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(v|u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(v|u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(v|u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(v|u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(v|u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(v|u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(v|u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(v|u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(v|u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(u) f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{Y|X}(u) f_{X}(u) dv \right) dv$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{X}(u) dv \right) du$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{X}(u) dv \right) dv$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{X}(u) dv \right) dv$$

$$= \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} (v - q(u))^{2} f_{X}(u) dv \right) du$$

..
$$E((Y-g(x))^2|X=u)$$
 is minimized at $g(x)=E(Y|X=u)$ for a fixed $X=u$

$$\therefore \qquad q^*(x) = E(Y|x)$$

$$E(Y-Q^*(X))^2 = E(Y-E(Y|X))^2$$

$$= E(Y^2) - E[(E(Y|X))^2]$$

$$+ DW? VERY SIMILAR TO Var(Y) = EY^2 - (EY)^2$$

$$Applied USING THE CONDITIONAL DISTRIBUTION OF Y GIVEN X$$
