The title is a key element of any form of scientific communication.

The quality and effectiveness of your title is critical in attracting a reader’s attention and in getting appropriate “hits” in electronic databases.

Here, we focus on how to write a title for maximum effect.
You’ll need effective titles for all sorts of things, not just journal articles

- Internal reports to bosses
- Technical reports to customers
- Proposals to customers and funding agencies
- Talks
- Websites and electronic media

Learning to write effective titles is important for more people than academic physicists who write journal articles.
Scientists scan down a list of titles in the table of contents in a journal, or the latest postings to one of the electronic archives, or to the results of an electronic lit search; you have ≈1 sec to capture their attention.

Try an experiment. Go to http://arXiv.org/list/physics/recent, and see how much time you spend looking at the titles of each article as you scan down the list before you decide whether a paper looks interesting and worth investigating further.
Busy scientists employ three criteria when deciding if they will invest their time in reading a paper or attending a talk:

1. The information conveyed in the title.
2. The reputation of the author—if you’re a young scientist without a reputation yet, see #1 and #3.
3. The abstract (more about abstracts next week...)

The title must accurately and succinctly convey the content of the paper and allow a busy reader to immediately decide if the paper is applicable to his or her work.
Write down key words that define and describe your paper. These are the words that belong in your title.

A title cannot capture every nuance of every detail of the paper, but it should accurately and specifically represent “the big picture.”
The title must accurately and succinctly convey the content of the paper.

Play fair; don’t “trick” people into reading your paper by a misleading title. Wastes their time. Ruins your reputation (see point #2 on Slide 4).
Make it interesting, but not too interesting...

“Looking from the East at an Elephant Trotting West: Direct CP Violation in B⁰ Decays”

No comment necessary.
Limit titles to <12 words; <10 is even better. That’s about the span of words the human eye can recognize and process as it is scanning down a list.

Important papers don’t have to have long, “impressive” titles:

Help your poor reader; put keywords first

Original Title: Application of the time-dependent local density approximation to conjugated molecules

My edit: *Time-dependent local density approximation for conjugated molecules*

Original Title: A novel approach to estimate the stability of one-dimensional quantum inverse scattering

My edit: *New stability estimate for 1D quantum inverse scattering*

Have pity on your busy, overwhelmed readers. Make it easy for them to understand the subject of your paper immediately.

Front load the key words to attract a busy reader’s attention.

Examples:
Original Title #1: 11 words, introductory fluff
Improvement #1: 8 words, keywords front loaded

Original Title #2: 13 words, introductory fluff, “a novel approach” will be discussed next...
Improvement #2: 8 words, keywords first
No introductory fluff

On the nature of the “hostless” short GRBs

Capabilities of parallel analyses of the structure of materials by field ion and scanning probe microscopy

Unveiling the impurity band induced ferromagnetism in the magnetic semiconductor (Ga,Mn)As

“Frontload” key words; get them on the left side of the list to grab a reader’s attention

Good advice from AIP: “Words that do not carry information, such as “The...,” “A...,” “On...,” “Investigation of...,” “Study of...” should be omitted from titles.”

The *Phys. Rev.* journals also proscribe

“More about...”, “...revisited”, and dangling participles (“...using...”)
No introductory fluff

On the nature of the “hostless” short GRBs
“Hostless” short gamma ray bursts

Capabilities of parallel analyses of the structure of materials by field ion and scanning probe microscopy (14 words)
Field ion vs scanning probe microscopy for materials characterization (9 words)

Unveiling the impurity band induced ferromagnetism in the magnetic semiconductor (Ga,Mn)As
Impurity band-induced ferromagnetism in (Ga,Mn)As

Write out acronyms in all titles; not every potential reader may know what a GRB is.
Do not use words in the title that make qualitative statements about the work being reported:

“precise,” “accurate”
“important,” “influential”
“innovative,” “unique,” “unprecedented,” “ground-breaking,” “brilliant”

“new”--maybe

Quantitative statements are okay, e.g., “Measurement of the negative muon anomalous magnetic moment to 0.7 ppm,” G.W. Bennett et al., Phys. Rev. Lett. 92, 161802 (2004).
Do not use the names of people*, places*, coined words, equations

*unless it’s standard nomenclature, e.g., Lorentz force, quantum Hall effect, de Broglie wavelength

The *Phys. Rev.* journals also proscribe the name of the accelerator or the type of detector used in paper titles (but the particle physicists seem to violate this rule constantly and with impunity—*cme*).

“people’s names”—unless they are a common adjective. “Fourier transform,” “Green’s function,” “Auger spectroscopy,” “Brillouin limit” are fine. “Important New Results from the Madhavan Laboratory at the University of Illinois” is not.

“equations”—don’t put anything in a title that cannot be rendered in straight
No unfamiliar acronyms

Original Title: One-dimensional SPH method
My edit: Smoothed-particle hydrodynamics 1D method for gas dynamics applications

Original Title: Application of CVS filtering to mixing in two-dimensional homogeneous turbulence
My edit: Coherent-vortex-simulation filtering for 2D homogeneous turbulence

“unfamiliar acronyms”—the AIP Style Guide provides a list of acronyms that are so common they don’t have to be defined at first use; anything else, leave out of the title or define it.

Examples of allowed acronyms: BCS, bcc, cw, EPR, ESR, fcc, ir, NMR, QCD, QED, rf, RNA, uv

Original Title: One-dimensional SPH method
IMPROVED Title: Smoothed-particle hydrodynamics 1D method for gas dynamics applications

NOTE: Although this title is longer than the original, it avoids the unfamiliar acronym and provides specific information that may be needed by the reader; the original title is probably too generic to be useful.

Original Title: Application of CVS filtering to mixing in two-dimensional homogeneous turbulence
IMPROVED Title*: Coherent-vortex-simulation filtering for 2D homogeneous turbulence

*This example may or may not be an “improved” title; it depends on what the author deems is most important and would be of most interest to readers.
How do I decide what words to capitalize in a title?*

Some journals use “title” capitalization and some use “sentence” capitalization

*Physical Review Letters*
“Complexity of Small Silicon Self-Interstitial Defects”

*Physical Review B*
“Electronic excitations on silver surfaces”

*Science*
“Evidence for 2D Ising superconductivity in gated MoS2”

Always capitalize the names of proper nouns, even when using sentence capitalization
“Classification of gapless $\mathbb{Z}_2$ spin liquids in 3D Kitaev models”

*Just look it up…*

There’s no consistency to the use of capitalization in paper titles—not even among journals published by the same organization. Just look it up. If you’re sure you know, look it up anyway; you will learn humility.

*Acta Crystallographica*
Crystallography of a new metastable phase in Zr-N alloy

*Nuclear Physics B*
Five-loop $\epsilon$ expansion for $O(n) \times O(m)$ spin models

*Physical Review Letters*
Extracting Information about the Initial State from Black Hole Radiation

*Physical Review B*
Emergence of integer quantum Hall effect from chaos

*Science*
Activation of Cu(111) surface by decomposition into nanoclusters driven by C) adsorption

In “title” capitalization, the first word and all words except prepositions and articles are capitalized.

In “sentence” capitalization, only the first word, proper nouns, and some acronyms are capitalized.

More capitalization rules for science writing:
Now for some practice:

Remember: A good title is concise, descriptive, interesting
“Investigation of accumulation, evolution, and penetration of gaseous products produced by nuclear fission reactions”

*Behavior of gaseous nuclear-fission products*
“An Overall Picture of the Gas Flow in Massive Cluster Forming Region: The Case of G10.6-0.4”

Gas Flow in Massive Cluster-Forming Region G10.6-0.4

As a matter of principle, I don’t like colon-ated titles; they are often just an excuse for a run-on title—cme
“Pair contact process with diffusion of pairs”
“Pair contact process with diffusion of pairs”
“Optimization of the Neutrino Factory, revisited”

knowing what kind of “optimization” would be nice, too
“A note on the implications of gauge invariance in QCD”
“Unique nature of the lowest Landau level in finite graphene samples with zigzag edges: Dirac electrons with mixed bulk-edge character”
Hinchcliffe’s rule for titles:

IS HINCHLIFFE’S RULE TRUE?

Boris Pooh

Abstract

Hinchcliffe has asserted that whenever the title of a paper is a question with a yes/no answer, the answer is always no. This paper demonstrates that Hinchcliffe’s assertion is false, but only if it is true.

We’ll talk about abstracts next week
To recap:

Keep it short
Frontload key words
Provide specific information
Make it interesting
