Heap Memory - Allocating Arrays

```
heap-puzzle3.cpp

int *x;
int size = 3;

x = new int[size];

for (int i = 0; i < size; i++) {
    x[i] = i + 3;
}

delete[] x;</pre>
```

*: new[] and delete[] are identical to new and delete, except the constructor/destructor are called on each object in the array.

Memory and Function Calls

Suppose we want to join two Cubes together:

```
joinCubes-byValue.cpp
11
12
    * Creates a new Cube that contains the exact volume
13
     * of the volume of the two input Cubes.
     */
14
15
    Cube joinCubes(Cube c1, Cube c2) {
     double totalVolume = c1.getVolume() + c2.getVolume();
16
17
18
     double newLength = std::pow( totalVolume, 1.0/3.0 );
19
20
     Cube result(newLength);
21
      return result;
22
```

By default, arguments are "passed by value" to a function. This means that:

•

•

Alterative #1: Pass by Pointer

```
joinCubes-byPointer.cpp

15  Cube joinCubes(Cube * c1, Cube * c2) {
    double totalVolume = c1->getVolume() + c2->getVolume();

17

18    double newLength = std::pow( totalVolume, 1.0/3.0 );

19
20    Cube result(newLength);
21    return result;

22  }
```

Alternative #2: Pass by Reference

```
joinCubes-byReference.cpp

15    Cube joinCubes(Cube & c1, Cube & c2) {
        double totalVolume = c1.getVolume() + c2.getVolume();

17

18        double newLength = std::pow( totalVolume, 1.0/3.0 );

19
20        Cube result(newLength);
        return result;

21    }
```

Contrasting the three methods:

	By Value	By Pointer	By Reference
Exactly what is copied when the function is invoked?			
Does modification of the passed in object modify the caller's object?			
Is there always a valid object passed in to the function?			
Speed			
Safety			

Using the const keyword

1. Using const in function parameters:

```
joinCubes-by*-const.cpp

15 Cube joinCubes(const Cube s1, const Cube s2)

15 Cube joinCubes(const Cube *s1, const Cube *s2)

15 Cube joinCubes(const Cube &s1, const Cube &s2)
```

```
Best Practice: "All parameters passed by reference must be labeled const." – Google C++ Style Guide
```

2. Using const as part of a member functions' declaration:

```
Cube.h
    #pragma once
 2
 3
    namespace cs225 {
      class Cube {
 4
 5
        public:
 6
          Cube();
          Cube (double length);
 8
          double getVolume()
          double getSurfaceArea()
10
11
        private:
12
          double length ;
13
      };
14
```

Returning from a function

Identical to passing into a function, we also have three choices on how memory is used when returning from a function:

Return by value:

```
15 Cube joinCubes(const Cube &s1, const Cube &s2)
```

Return by reference:

```
15 Cube &joinCubes(const Cube &s1, const Cube &s2)
```

...remember: never return a reference to stack memory!

Return by pointer:

```
15 Cube *joinCubes(const Cube &s1, const Cube &s2)
```

...remember: never return a reference to stack memory!

Copy Constructor

When a non-primitive variable is passed/returned **by value**, a copy must be made. As with a constructor, an automatic copy constructor is provided for you if you choose not to define one:

All **copy constructors** will:

The automatic copy constructor:

1.

2.

To define a **custom copy constructor**:

```
Cube.h

4 class Cube {
5 public:
... // ...
9 Cube(const Cube & other); // custom copy ctor
```

CS 225 – Things To Be Doing:

- 1. Exam o is ongoing
- 2. lab_debug due Sunday (11:59pm)
- **3.** MP1 due Monday (11:59pm)
- 4. Daily POTDs every weekday
