

**CS 2 2 5 #20:** AVL Analysis October 14, 2020 · *G* Carl Evans

#### **AVL Insertion**

### **AVL Removal**

### **Running Times:**

	AVL Tree
find	
insert	
remove	

# **Motivation:**

Big-O is defined as:

Let **f(n)** describe the height of an AVL tree in terms of the number of nodes in the tree (**n**). Visually, we can represent the big-O relation:

 $f(n) \le c \times g(n)$ : Provides an <u>upper bound</u>:

The height of the tree, **f(n)**, will always be <u>less than</u> **c** × **g(n)** for all values where **n** > **k**.

 $f^{-1}(h) \ge c \times g^{-1}(h)$ : Provides a lower bound:

The number of nodes in the tree,  $f^{-1}(h)$ , will always be <u>greater</u> <u>than</u>  $c \times g^{-1}(h)$  for all values where  $\mathbf{n} > \mathbf{k}$ .

### **Plan of Action:**

Goal: Find a function that defines the lower bound on **n** given **h**.

Given the goal, we begin by defining a function that describes the smallest number of nodes in an AVL of height h:

Proving our IH:

**V.** Using a proof by induction, we have shown that:

...and by inverting our finding:

Theorem:

An AVL tree of height **h** has at least \_\_\_\_\_\_.

I. Consider an AVL tree and let **h** denote its height.

**II.** Case: \_\_\_\_\_

**III.** Case: \_\_\_\_\_\_

### **Summary of Balanced BSTs:**

Disadvantages

**IV.** Case: \_\_\_\_\_

Inductive hypothesis (IH):

## CS 225 – Things To Be Doing:

- **1.** mp\_traversals due Monday!
- lab\_avl starts today
  Daily POTDs are ongoing!
