# Informal Early Feedback

The instructor is well-prepared for each class / recording  
13 responses

- Strongly disagree
- Disagree
- Neutral
- Agree
- Strongly agree

# Informal Early Feedback

I feel that I can actively participate in lecture

13 responses

I feel that I can actively participate in class in general

13 responses

# Informal Early Feedback

I receive helpful and complete answers to my questions

During lecture

Outside lecture

- Strongly disagree
- Disagree
- Neutral
- Agree
- Strongly agree

# Informal Early Feedback

Lecture helpfulness

Assignment helpfulness

- 1 - Not at all helpful
- 2
- 3
- 4
- 5 - Very helpful

# Informal Early Feedback

The discord is pretty useful, as the instructor often responds to answer questions.

It's hard to decide between the lectures and assignments. Both have been instrumental.

recorded lectures / slides [are the most helpful]

Getting some of the hidden test cases or charComps test cases is very difficult. I would like it more if these test cases were given or revealed, though I understand if this isn't possible.

Maybe spend more time on big O analysis. It's really confusing sometimes.

I wish we could move back to in-person lectures.

# Exact pattern matching *w/ indexing*

	<b>Suffix tree</b>	<b>Suffix array</b>
Time: Does P occur?		
Time: Report $k$ locations of P		
Space		

$m = |T|$ ,  $n = |P|$ ,  $k = \#$  occurrences of  $P$  in  $T$

# Suffix tree vs suffix array: size

The suffix array has a smaller constant factor than the tree

Suffix tree: ~16 bytes per character

Suffix array: ~4 bytes per character

Raw text: 2 bits per character

# Exact pattern matching *w/ indexing*

The basis of the FM index is a *transformation*

**B A N A N A \$**

**A N N B \$ A A**

# Burrows-Wheeler Transform

***Reversible permutation*** of the characters of a string

# Text rotations

A string is a 'rotation' of another string if it can be reached by wrap-around shifting the characters

**a b c d e f \$**  
**b c d e f \$ a**  
**c d e f \$ a b**  
**d e f \$ a b c**  
**e f \$ a b c d**  
**f \$ a b c d e**  
**\$ a b c d e f**

(after this they  
repeat)

# Text Rotations

A string is a 'rotation' of another string if it can be reached by wrap-around shifting the characters

Which of these are rotations of 'ABCD'?

A) BCDA

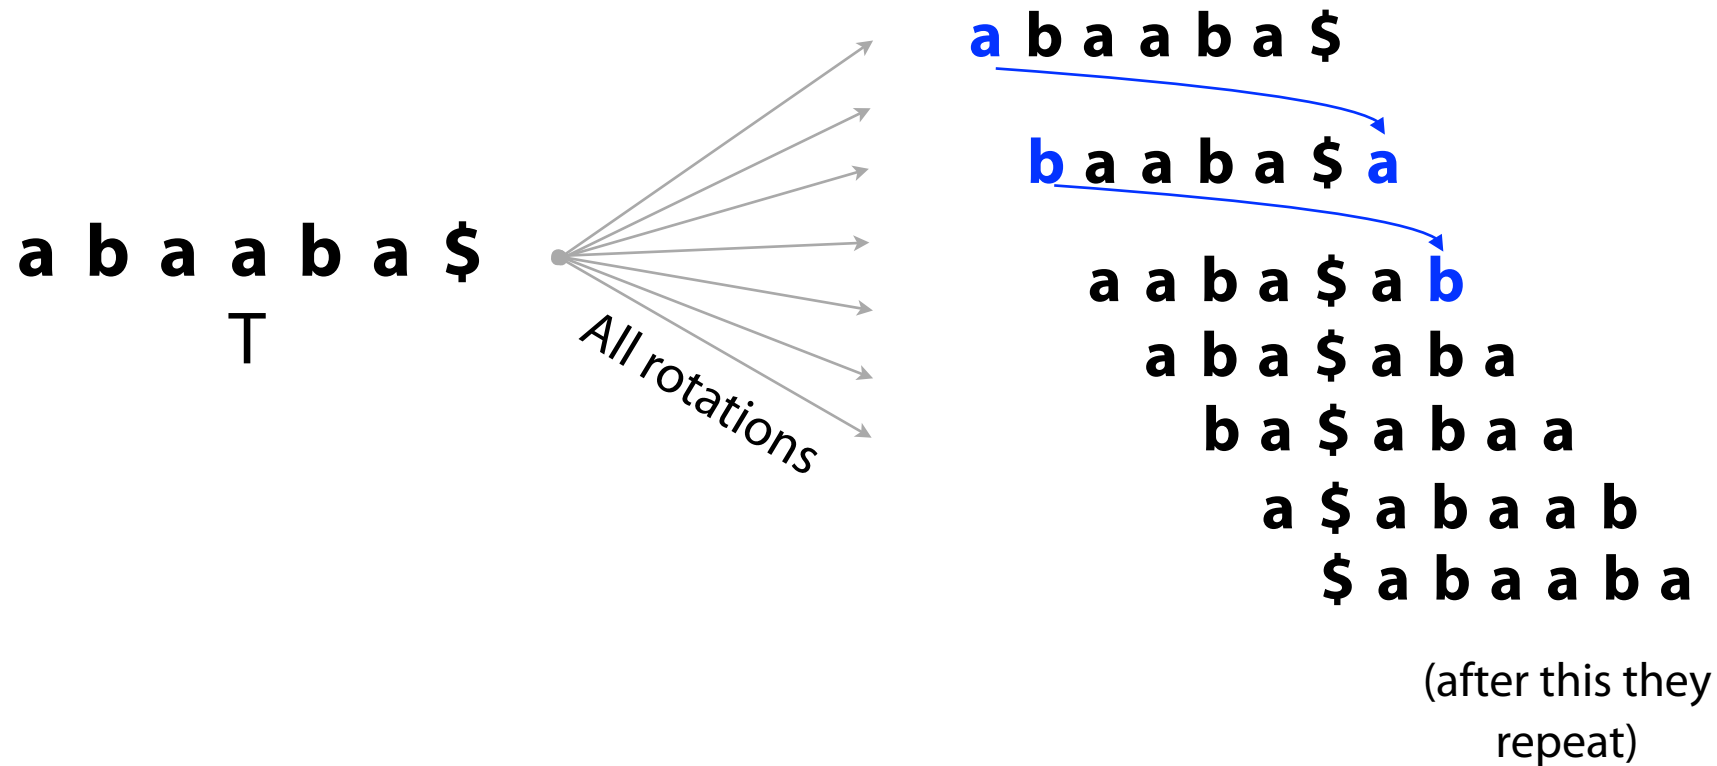

B) BACD

C) DCAB

D) CDAB

# Burrows-Wheeler Transform

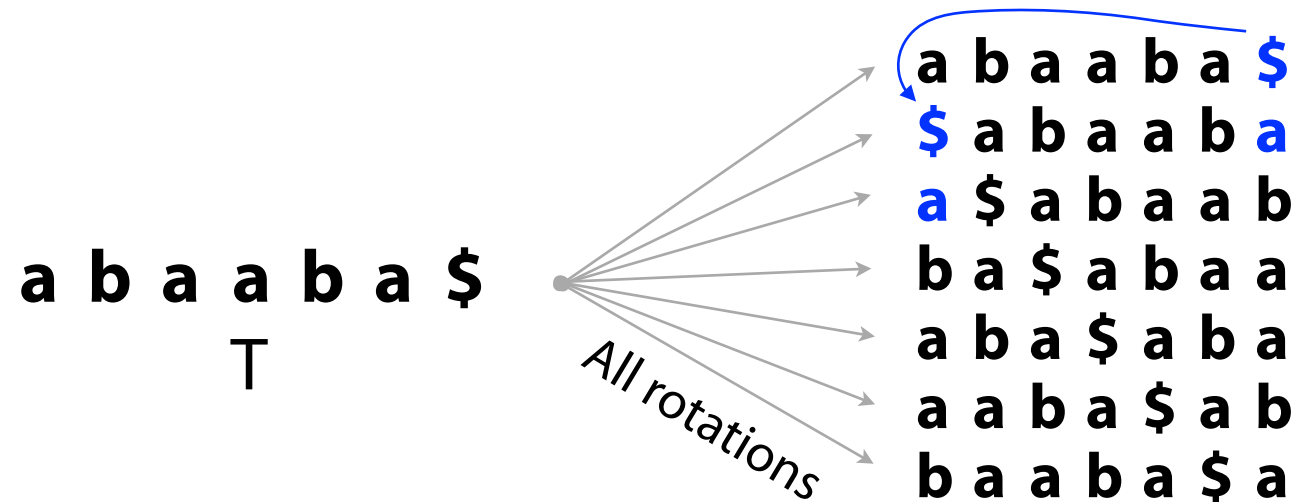

*Reversible permutation* of the characters of a string

# Burrows-Wheeler Transform

*Reversible permutation* of the characters of a string

# Burrows-Wheeler Transform

*Reversible permutation* of the characters of a string

# Burrows-Wheeler Transform

- (1) Build all rotations
- (2) Sort all rotations
- (3) Take last column

**T = c a r \$**

# Burrows-Wheeler Transform

- (1) Build all rotations
- (2) Sort all rotations
- (3) Take last column

# Assignment 8: a\_bwt

Learning Objective:

Implement the Burrows-Wheeler Transform on text

Reverse the Burrows-Wheeler Transform to reproduce text

**Consider:** How can the BWT be stored *smaller* than the original text?

# Burrows-Wheeler Transform

How to reverse the BWT?

# Burrows-Wheeler Transform

$BWT(T) = \mathbf{r\ c\ \$\ a}$        $T = \mathbf{c\ a\ r\ \$}$

# Burrows-Wheeler Transform

BWT(T) = **r c \$ a**      T = **c a r \$**

- 1) Prepend the BWT as a column
- 2) Sort the full matrix as rows
- 3) Repeat 1 and 2 until full matrix
- 4) Pick the row ending in '\$'

# Burrows-Wheeler Transform

BWT(T) = **r c \$ a**      T = **c a r \$**

**\$**   **c**   **a**   **r**

**a**   **r**   **\$**   **c**

**c**   **a**   **r**   **\$**

**r**   **\$**   **c**   **a**

**\$**

**a**

**c**

**r**

# Burrows-Wheeler Transform

BWT(T) = **r c \$ a**

T = **c a r \$**

**\$ c a r**

**a r \$ c**

**c a r \$**

**r \$ c a**

**\$ c**

**a r**

**c a**

**r \$**

# Burrows-Wheeler Transform

BWT(T) = **r c \$ a**      T = **c a r \$**

**\$**   **c**   **a**   **r**

**a**   **r**   **\$**   **c**

**c**   **a**   **r**   **\$**

**r**   **\$**   **c**   **a**

**\$**   **c**   **a**

**a**   **r**   **\$**

**c**   **a**   **r**

**r**   **\$**   **c**

# Burrows-Wheeler Transform

What is the right context of **a p p l e \$** ?

**l e \$ a p**

A letter always has the same right context.

\$	a	p	<b>p</b>	l	e
a	p	<b>p</b>	l	e	\$
e	\$	a	p	<b>p</b>	l
l	e	\$	a	p	<b>p</b>
<b>p</b>	l	e	\$	a	p
p	<b>p</b>	l	e	\$	a

# Burrows-Wheeler Transform: T-ranking

To continue, we have to be able to uniquely identify each character in our text.

Give each character in  $T$  a rank, equal to # times the character occurred previously in  $T$ . Call this the  $T$ -ranking.

**a b a a b a \$**

Ranks aren't explicitly stored; they are just for illustration

# Burrows-Wheeler Transform

BWM with T-ranking:

<i>F</i>							<i>L</i>
\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	<b>a<sub>3</sub></b>
<b>a<sub>3</sub></b>	\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	b <sub>1</sub>
<b>a<sub>1</sub></b>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	b <sub>0</sub>
<b>a<sub>2</sub></b>	b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	<b>a<sub>1</sub></b>
<b>a<sub>0</sub></b>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	\$
b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	<b>a<sub>2</sub></b>	<b>a<sub>2</sub></b>
b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	<b>a<sub>0</sub></b>	<b>a<sub>0</sub></b>

Look at first and last columns, called *F* and *L* (and look at just the **as**)

**a**s occur in the same order in *F* and *L*. As we look down columns, in both cases we see: **a<sub>3</sub>, a<sub>1</sub>, a<sub>2</sub>, a<sub>0</sub>**

# Burrows-Wheeler Transform

BWM with T-ranking:

<i>F</i>						<i>L</i>
\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>
a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	<b>b<sub>1</sub></b>
a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>	<b>b<sub>0</sub></b>
a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>
a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$
<b>b<sub>1</sub></b>	a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>
<b>b<sub>0</sub></b>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>

Same with **bs**: **b<sub>1</sub>**, **b<sub>0</sub>**

# Burrows-Wheeler Transform: LF Mapping

BWM with T-ranking:

$F$							$L$
\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	
a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	
a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	
a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	
a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	
b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>	b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	
b <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>	b <sub>1</sub>	a <sub>3</sub>	\$	a <sub>0</sub>	

LF Mapping: The  $i^{\text{th}}$  occurrence of a character  $c$  in  $L$  and the  $i^{\text{th}}$  occurrence of  $c$  in  $F$  correspond to the *same* occurrence in  $T$  (i.e. have same rank)

# Burrows-Wheeler Transform: LF Mapping

Why does this work?

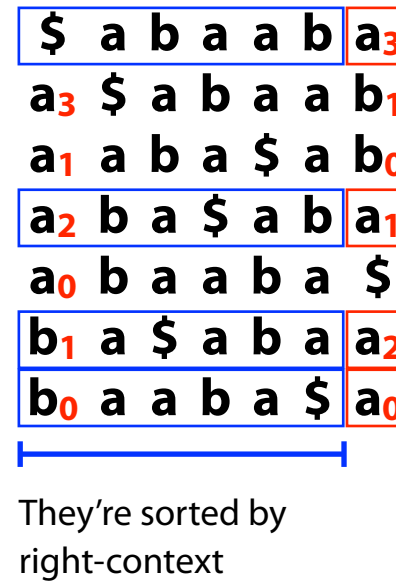

These characters have the same right contexts!

These characters *are the same character!*      **a<sub>0</sub> b<sub>0</sub> a<sub>1</sub> a<sub>2</sub> b<sub>1</sub> a<sub>3</sub> \$**

# Burrows-Wheeler Transform: LF Mapping

Why does this work?

Why are these **a**s in this order relative to each other?

Why are these **a**s in this order relative to each other?

Occurrences of  $c$  in  $F$  are sorted by right-context. Same for  $L$ !

**Any ranking** we give to characters in  $T$  will match in  $F$  and  $L$

# Burrows-Wheeler Transform: LF Mapping

LF Mapping can be used to recover our original text too!

Given BWT = **a<sub>3</sub>** **b<sub>1</sub>** **b<sub>0</sub>** **a<sub>1</sub>** \$ **a<sub>2</sub>** **a<sub>0</sub>**

What is L?

What is F?

# Burrows-Wheeler Transform: LF Mapping

LF Mapping can be used to recover our original text too!

**Start** in first row.  $F$  must have \$.

$L$  contains character just **prior** to \$:  $a_3$

**Jump** to row *beginning* with  $a_0$ .

$L$  contains character just **prior** to  $a_0$ :  $b_0$ .

Repeat for  $b_0$ , get  $a_2$

Repeat for  $a_2$ , get  $a_1$

Repeat for  $a_1$ , get  $b_1$

Repeat for  $b_1$ , get  $a_3$

Repeat for  $a_3$ , get \$ (done)

$F$	$L$
\$	$a_3$
$a_3$	$b_1$
$a_1$	$b_0$
$a_2$	$a_1$
$a_0$	\$
$b_1$	$a_2$
$b_0$	$a_0$

# Burrows-Wheeler Transform: LF Mapping

Another way to visualize:

$T: a_0 b_0 a_1 a_2 b_1 a_3 \$$

# Assignment 8: a\_bwt

Learning Objective:

Implement the Burrows-Wheeler Transform on text

Reverse the Burrows-Wheeler Transform to reproduce text

**Consider:** You can use either LF mapping or prepend-sort to reverse. Which do you think would be easier to implement (or more efficient)?

# Burrows-Wheeler Transform: A better ranking

**Any ranking** we give to characters in  $T$  will match in  $F$  and  $L$

T-Rank: Order by T

$F$	$L$
\$	<b>a<sub>3</sub></b>
<b>a<sub>3</sub></b>	<b>b<sub>1</sub></b>
<b>a<sub>1</sub></b>	<b>b<sub>0</sub></b>
<b>a<sub>2</sub></b>	<b>a<sub>1</sub></b>
<b>a<sub>0</sub></b>	\$
<b>b<sub>1</sub></b>	<b>a<sub>2</sub></b>
<b>b<sub>0</sub></b>	<b>a<sub>0</sub></b>

F-Rank: Order by F

$F$	$L$
\$	<b>a<sub>0</sub></b>
<b>a<sub>0</sub></b>	<b>b<sub>0</sub></b>
<b>a<sub>1</sub></b>	<b>b<sub>1</sub></b>
<b>a<sub>2</sub></b>	<b>a<sub>1</sub></b>
<b>a<sub>3</sub></b>	\$
<b>b<sub>1</sub></b>	<b>a<sub>2</sub></b>
<b>b<sub>0</sub></b>	<b>a<sub>3</sub></b>

What is good about f-rank?

# Burrows-Wheeler Transform: A better ranking

T = **a b b c c d \$**

What is the BWM index for my first instance of C? (**C**<sub>0</sub>) [0-base for answer]

<i>F</i>							<i>L</i>
<b>\$</b>	a	b	b	c	c		<b>d</b>
<b>a</b>	b	b	c	c	d		<b>\$</b>
<b>b</b>	b	c	c	d	\$		<b>a</b>
<b>b</b>	c	c	d	\$	a		<b>b</b>
<b>c</b>	c	d	\$	a	b		<b>b</b>
<b>c</b>	d	\$	a	b	b		<b>c</b>
<b>d</b>	\$	a	b	b	c		<b>c</b>

# Burrows-Wheeler Transform: A better ranking

Say  $T$  has 300 **A**s, 400 **C**s, 250 **G**s and 700 **T**s and  $\$ < \mathbf{A} < \mathbf{C} < \mathbf{G} < \mathbf{T}$

What is the BWM index for my 100th instance of **G**? (**G**<sub>99</sub>) [0-base for answer]

Skip row starting with **\$** (1 row)

Skip rows starting with **A** (300 rows)

Skip rows starting with **C** (400 rows)

Skip first 99 rows starting with **G** (99 rows)

**Answer:** skip 800 rows -> **index 800 contains my 100th G**

With a little preprocessing we can find any character in  $O(1)$  time!

# FM Index

*(Next week's material)*

An index combining the BWT with a few small auxiliary data structures

Core of index is **first (F)** and **last (L) rows** from BWM:

$L$  is the same size as  $T$

$F$  can be represented as array of  $|\Sigma|$  integers (or not stored at all!)

$F$							$L$
\$	a	b	a	a	b		<b>a</b>
<b>a</b>	\$	a	b	a	a		<b>b</b>
<b>a</b>	a	b	a	\$	a		<b>b</b>
<b>a</b>	b	a	\$	a	b		<b>a</b>
<b>b</b>	a	\$	a	b	a		<b>a</b>
<b>b</b>	a	a	b	a	\$		<b>a</b>

We're discarding  $T$  — *we can recover it from L!*

# FM Index: Querying

Can we query like the suffix array?

\$	a	b	a	a	b	a
a	\$	a	b	a	a	b
a	a	b	a	\$	a	b
a	b	a	\$	a	b	a
a	b	a	a	b	a	\$
b	a	\$	a	b	a	a
b	a	a	b	a	\$	a

6	\$
5	a \$
2	a a b a \$
3	a b a \$
0	a b a a b a \$
4	b a \$
1	b a a b a \$

We don't have these columns, and we don't have T.  
Binary search not possible.

# FM Index: Querying

The BWM is a lot like the suffix array — maybe we can query the same way?

\$	a	b	a	a	b	a
a	\$	a	b	a	a	b
a	a	b	a	\$	a	b
a	b	a	\$	a	b	a
a	b	a	a	b	a	\$
b	a	\$	a	b	a	a
b	a	a	b	a	\$	a

BWM(T)

6	\$
5	a \$
2	a a b a \$
3	a b a \$
0	a b a a b a \$
4	b a \$
1	b a a b a \$

SA(T)

# FM Index: Querying

The BWM is a lot like the suffix array — maybe we can query the same way?

\$	a	b	a	a	b	a
a	\$	a	b	a	a	b
a	a	b	a	\$	a	b
a	b	a	\$	a	b	a
a	b	a	a	b	a	\$
b	a	\$	a	b	a	a
b	a	a	b	a	\$	a

6	\$
5	a \$
2	a a b a \$
3	a b a \$
0	a b a a b a \$
4	b a \$
1	b a a b a \$

We don't have these columns, and we don't have T.

# FM Index: Querying

Look for range of rows of BWM(T) with  $P$  as prefix

Start with shortest suffix, then match successively longer suffixes

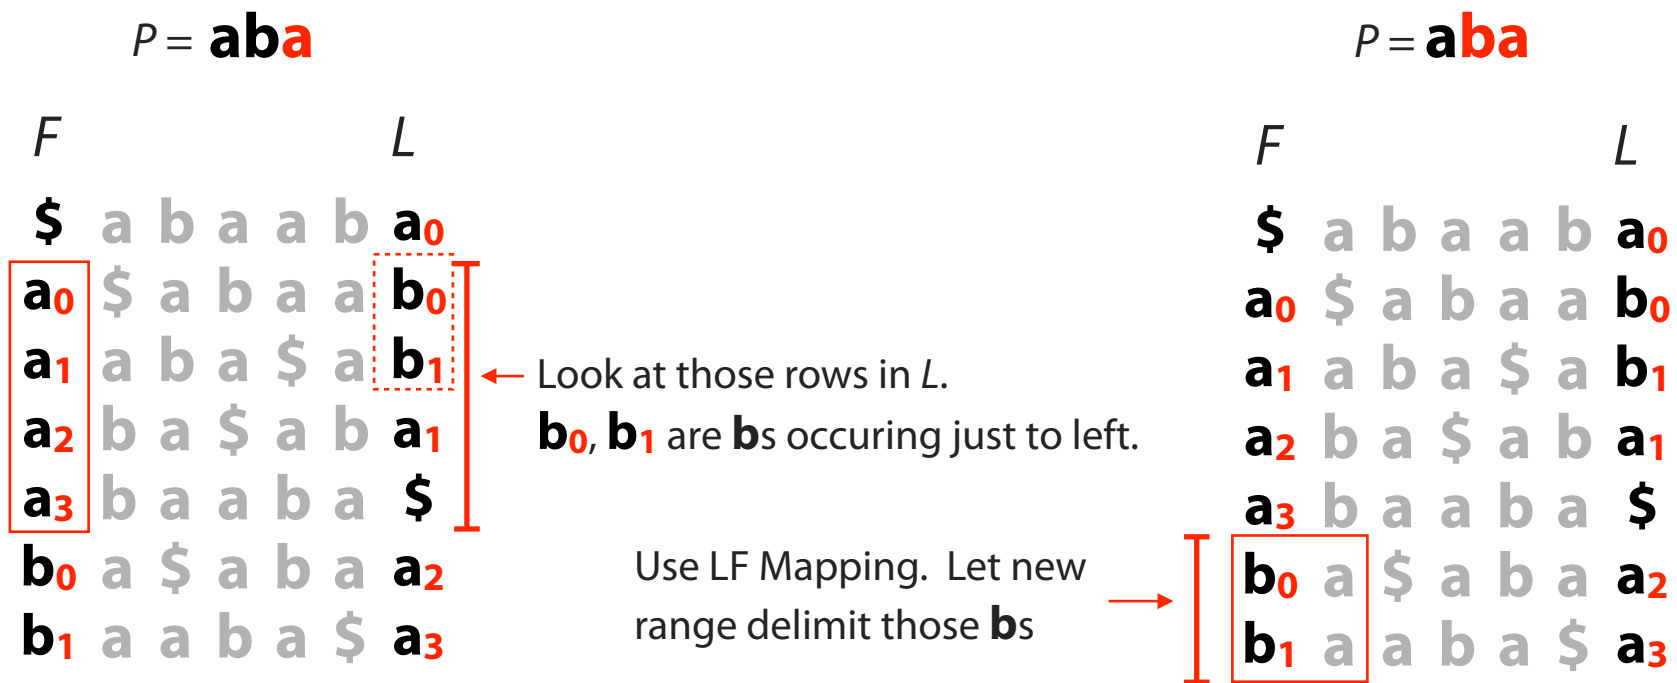

$P = \mathbf{aba}$

Easy to find all the rows  
beginning with **a**

	$F$						$L$
	\$	a	b	a	a	b	$a_0$
	<b><math>a_0</math></b>	\$	a	b	a	a	b
	<b><math>a_1</math></b>	a	b	a	\$	a	b
	<b><math>a_2</math></b>	b	a	\$	a	b	$a_1$
	<b><math>a_3</math></b>	b	a	a	b	a	\$
	<b>b</b>	a	\$	a	b	a	$a_2$
	<b>b</b>	a	a	b	a	\$	$a_3$

# FM Index: Querying

We have rows beginning with **a**, now we want rows beginning with **ba**

**Note:** We still aren't storing the characters in grey, we just know they exist.

# FM Index: Querying

We have rows beginning with **ba**, now we seek rows beginning with **aba**

Now we have the rows with prefix **aba**

# FM Index: Querying

When  $P$  does not occur in  $T$ , we eventually fail to find next character in  $L$ :

$P = \mathbf{bba}$

$F$

$L$

\$ a b a a b  $\mathbf{a_0}$

$\mathbf{a_0}$  \$ a b a a  $\mathbf{b_0}$

$\mathbf{a_1}$  a b a \$ a  $\mathbf{b_1}$

$\mathbf{a_2}$  b a \$ a b  $\mathbf{a_1}$

$\mathbf{a_3}$  b a a b a \$

Rows with **ba** prefix

$\left[ \begin{array}{l} \mathbf{b_0} \ a \ \$ \ a \ b \ a \ \mathbf{a_2} \\ \mathbf{b_1} \ a \ a \ b \ a \ \$ \ \mathbf{a_3} \end{array} \right]$

← No **bs**!

# FM Index: Querying

**Problem 1:** If we *scan* characters in the last column, that can be slow,  $O(m)$

$P = \mathbf{aba}$

	<i>F</i>					<i>L</i>	
	\$	a	b	a	a	b	<b>a<sub>0</sub></b>
<b>a<sub>0</sub></b>	\$	a	b	a	a	b	<b>b<sub>0</sub></b>
<b>a<sub>1</sub></b>	a	b	a	\$	a	b	<b>b<sub>1</sub></b>
<b>a<sub>2</sub></b>	b	a	\$	a	b	a	<b>a<sub>1</sub></b>
<b>a<sub>3</sub></b>	b	a	a	b	a	\$	
<b>b<sub>0</sub></b>	a	\$	a	b	a	a	<b>a<sub>2</sub></b>
<b>b<sub>1</sub></b>	a	a	b	a	\$	a	<b>a<sub>3</sub></b>

Scan, looking for **b**s

# FM Index: Querying

**Problem 2:** We don't immediately know *where* the matches are in T...

$P = \mathbf{aba}$  Got the same range,  $[3, 5)$ , we would have got from suffix array

	<i>F</i>		<i>L</i>				
	\$	a	b	a	a	b	$a_0$
	$a_0$	\$	a	b	a	a	$b_0$
	$a_1$	a	b	a	\$	a	$b_1$
$[3, 5)$	$a_2$	b	a	\$	a	b	$a_1$
	$a_3$	b	a	a	b	a	\$
	$b_0$	a	\$	a	b	a	$a_2$
	$b_1$	a	a	b	a	\$	$a_3$

Where are the values?

6	\$
5	a \$
2	a a b a \$
3	a b a \$
0	a b a a b a \$
4	b a \$
1	b a a b a \$
