October 5– Heaps and Priority Queues
G Carl Evans

Priority Queue Implementation

insert	removeMin
$O(1)$	$O(n)$
$O(1)$	$O(n)$
$O(n)$	$O(1)$
$O(n)$	$O(1)$

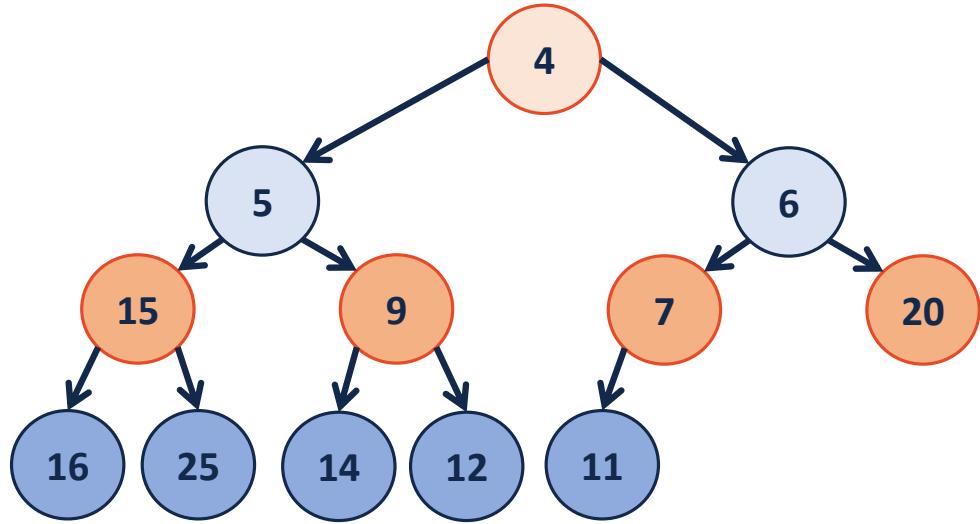

Another possible structure...

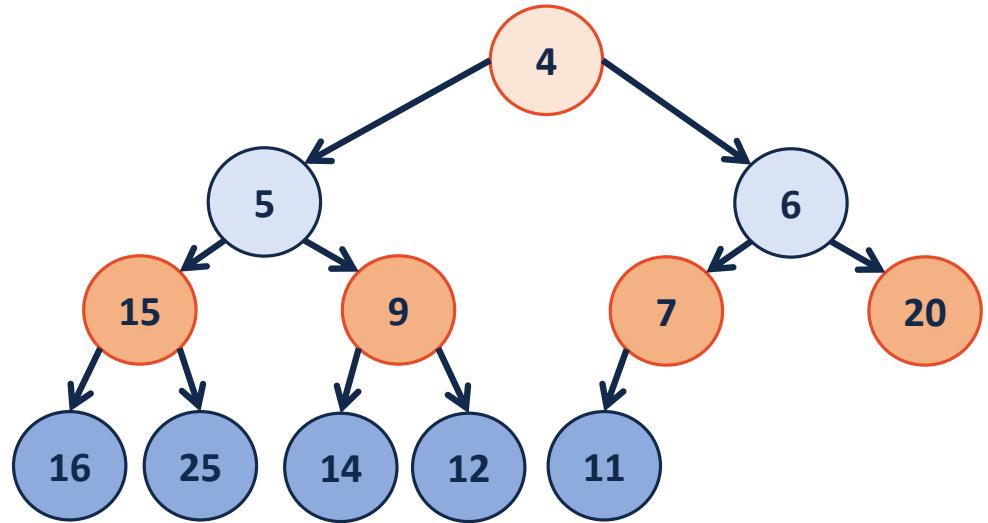

(min)Heap

A complete binary tree T is a min-heap if:

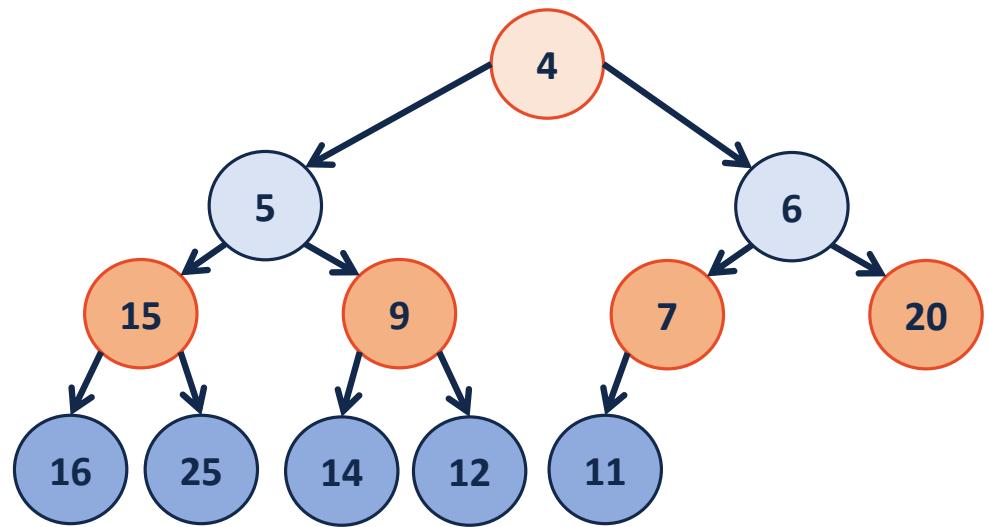

- $T = \{\}$ or
- $T = \{r, T_L, T_R\}$, where r is less than the roots of $\{T_L, T_R\}$ and $\{T_L, T_R\}$ are min-heaps.

(min)Heap

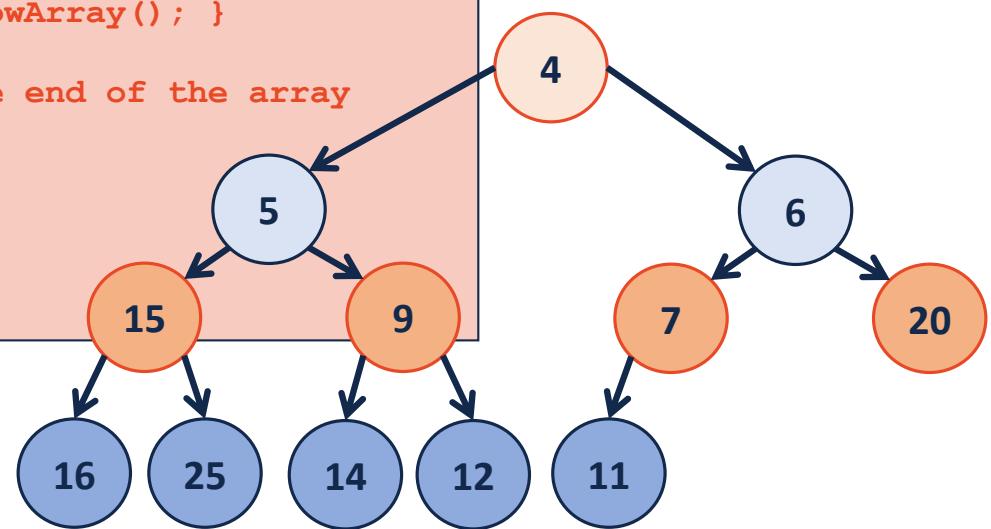

insert

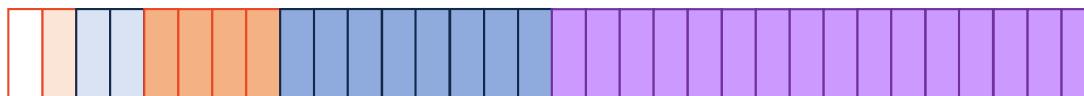

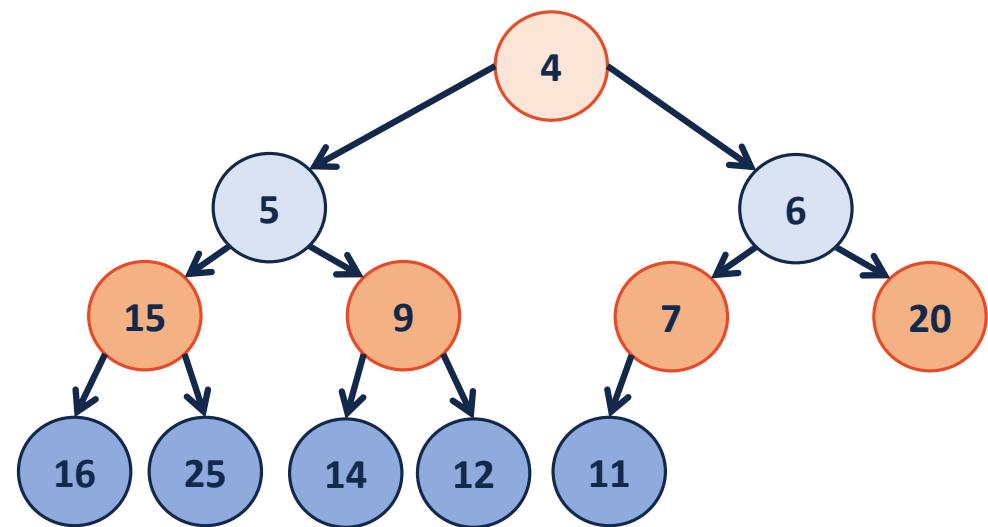

insert

```
1 template <class T>
2 void Heap<T>::_insert(const T & key) {
3     // Check to ensure there's space to insert an element
4     // ...if not, grow the array
5     if ( size_ == capacity_ ) { _growArray(); }
6
7     // Insert the new element at the end of the array
8     item_[++size] = key;
9
10    // Restore the heap property
11    _heapifyUp(size);
12 }
```

growArray

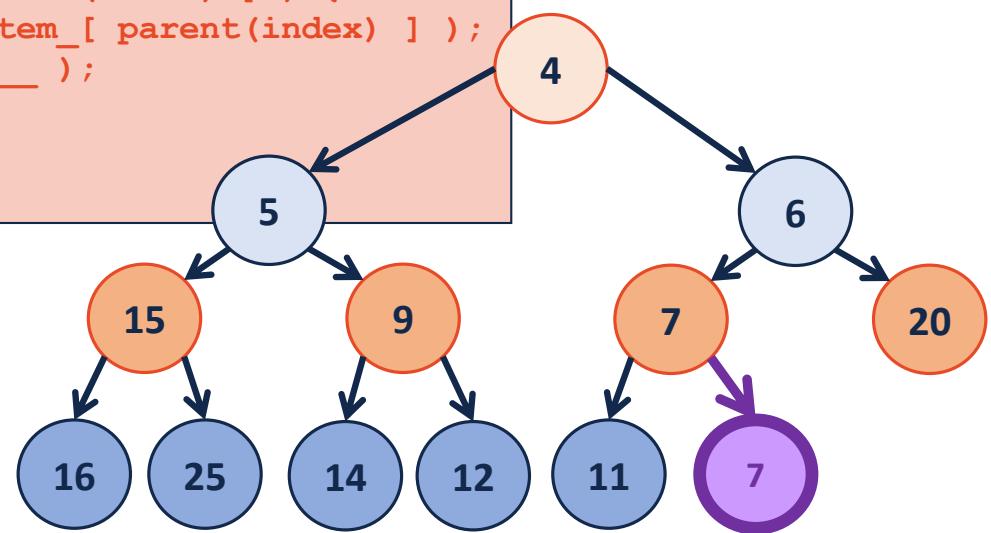

insert - heapifyUp

```
1 template <class T>
2 void Heap<T>::_insert(const T & key) {
3     // Check to ensure there's space to insert an element
4     // ...if not, grow the array
5     if ( size_ == capacity_ ) { _growArray(); }
6
7     // Insert the new element at the end of the array
8     item_[++size] = key;
9
10    // Restore the heap property
11    _heapifyUp(size);
12 }
```

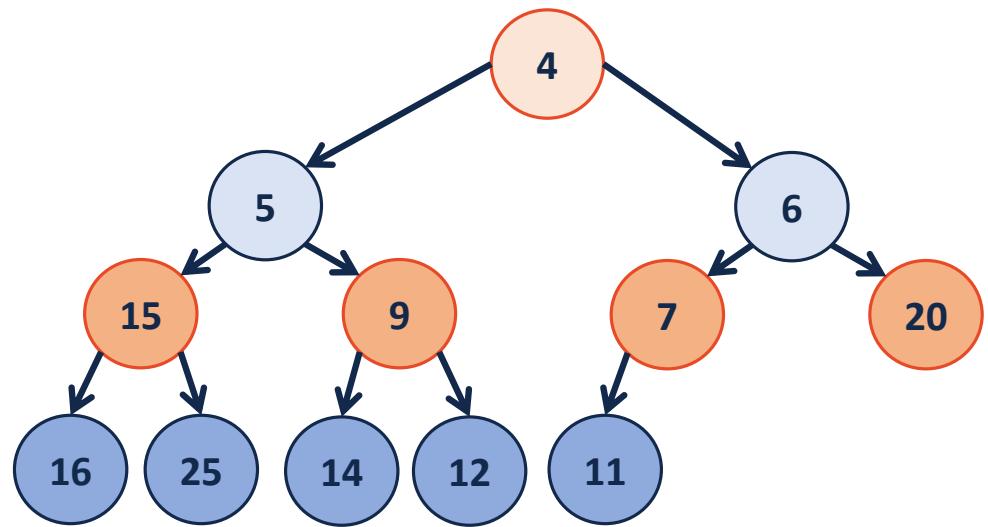

```
1 template <class T>
2 void Heap<T>::_heapifyUp( _____ ) {
3     if ( index > _____ ) {
4         if ( item_[index] < item_[ parent(index) ] ) {
5             std::swap( item_[index], item_[ parent(index) ] );
6             _heapifyUp( _____ );
7         }
8     }
9 }
```

heapifyUp

```
1 template <class T>
2 void Heap<T>::_heapifyUp( _____ ) {
3     if ( index > _____ ) {
4         if ( item_[index] < item_[ parent(index) ] ) {
5             std::swap( item_[index], item_[ parent(index) ] );
6             _heapifyUp( _____ );
7         }
8     }
9 }
```

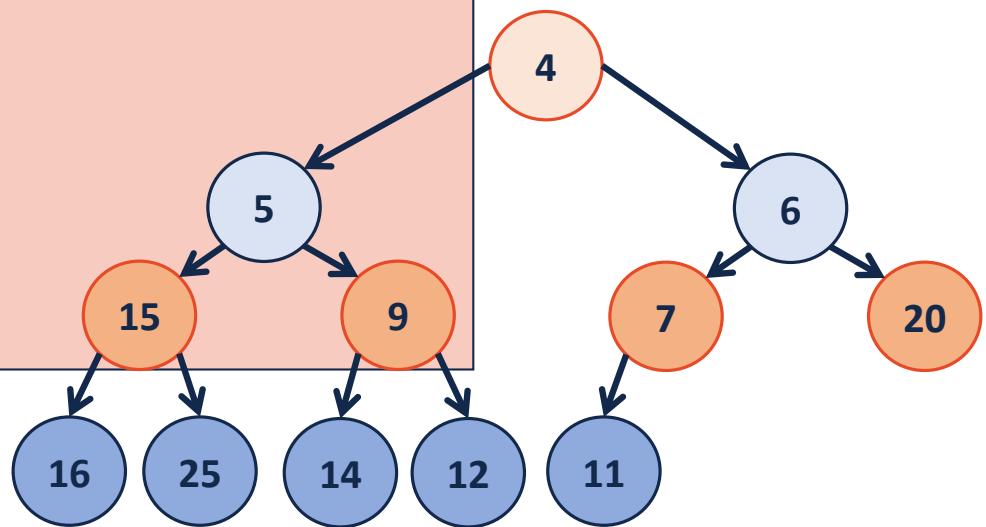

removeMin

removeMin

```
1 template <class T>
2 void Heap<T>::_removeMin() {
3     // Swap with the last value
4     T minValue = item_[1];
5     item_[1] = item_[size_];
6     size--;
7
8     // Restore the heap property
9     heapifyDown();
10
11    // Return the minimum value
12    return minValue;
13 }
```

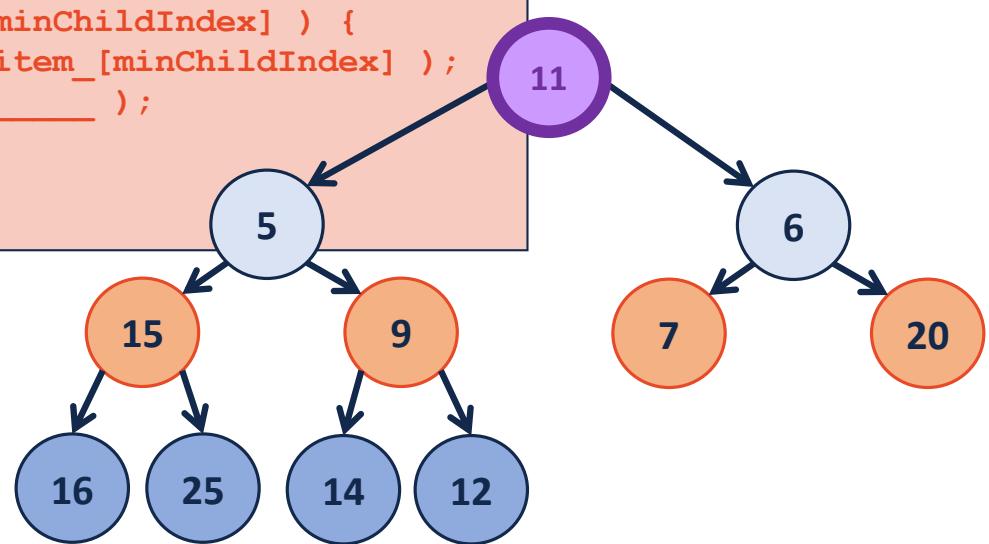

removeMin - heapifyDown

```
1 template <class T>
2 void Heap<T>::_removeMin() {
3     // Swap with the last value
4     T minValue = item_[1];
5     item_[1] = item_[size_];
6     size--;
7
8     // Restore the heap property
9     _heapifyDown();
10
11    // Return the minimum value
12    return minValue;
13 }
```

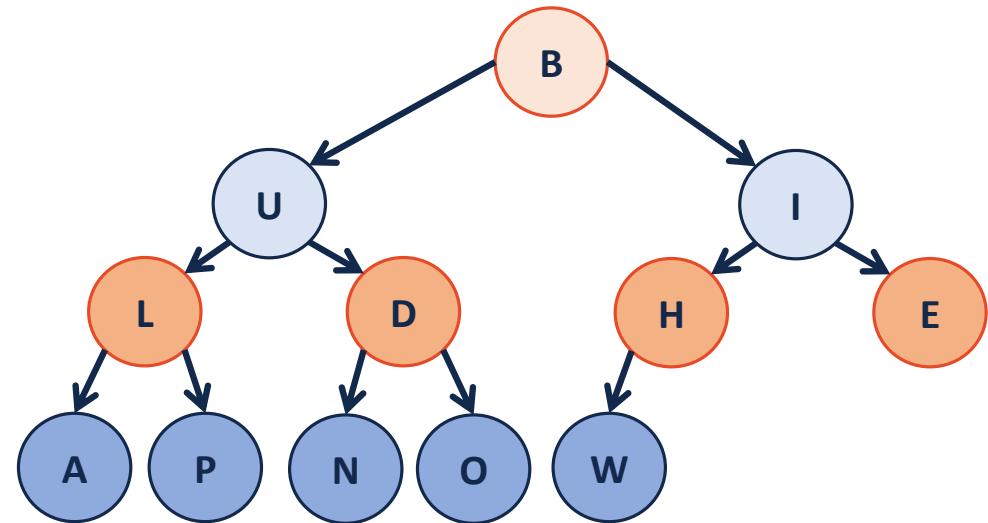

```
1 template <class T>
2 void Heap<T>::_heapifyDown(int index) {
3     if ( !_isLeaf(index) ) {
4         T minChildIndex = _minChild(index);
5         if ( item_[index] __ item_[minChildIndex] ) {
6             std::swap( item_[index], item_[minChildIndex] );
7             _heapifyDown( _____ );
8         }
9     }
10 }
```

removeMin

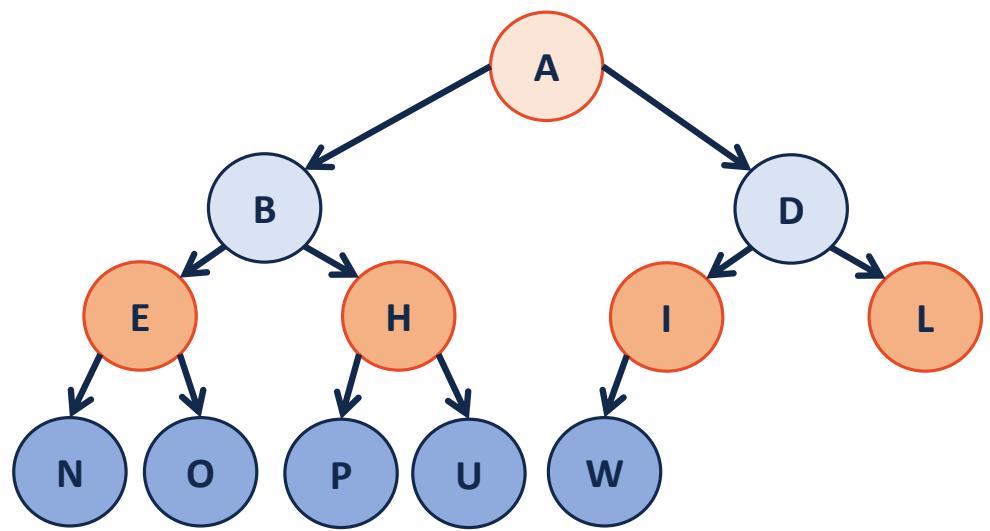

```
1 template <class T>
2 void Heap<T>::_heapifyDown(int index) {
3     if ( !_isLeaf(index) ) {
4         T minChildIndex = _minChild(index);
5         if ( item_[index] __ item_[minChildIndex] ) {
6             std::swap( item_[index], item_[minChildIndex] );
7             _heapifyDown( _____ );
8         }
9     }
10 }
```

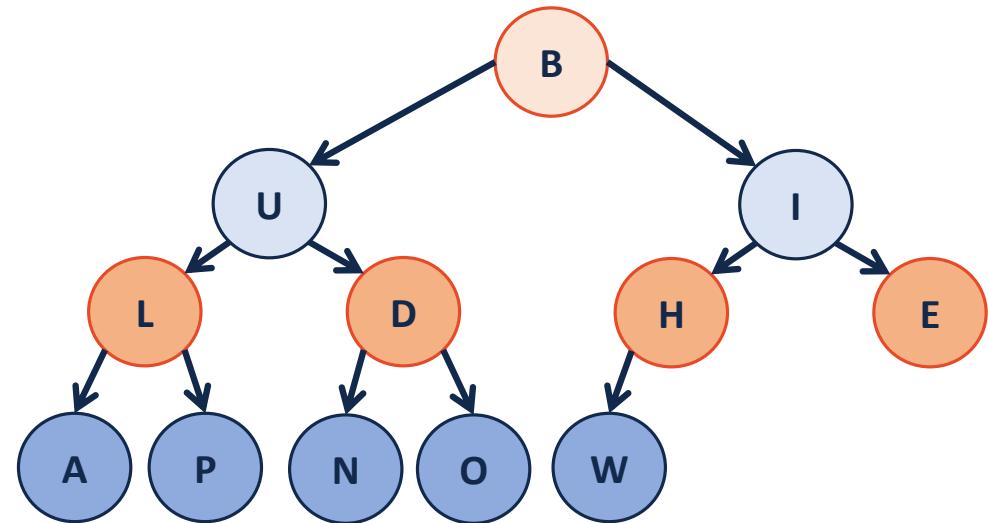

buildHeap

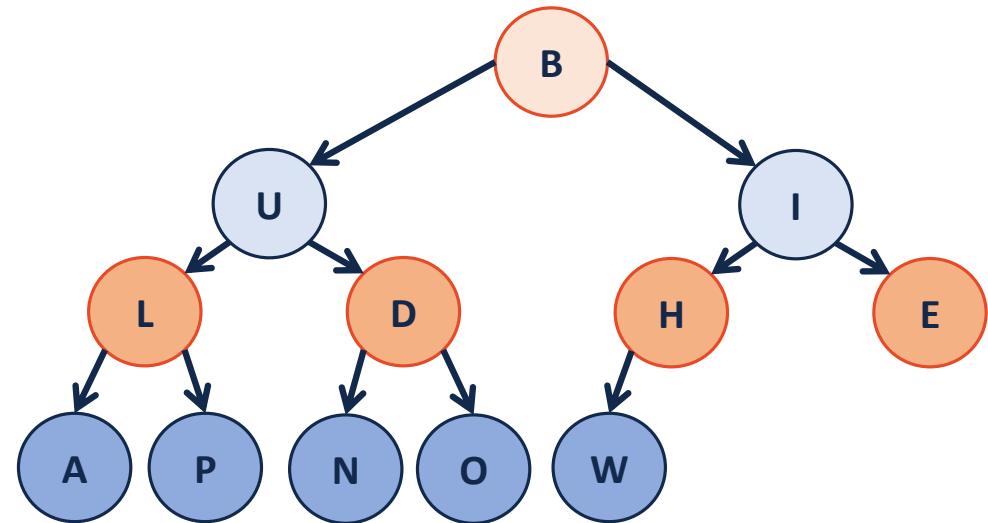

buildHeap – sorted array

buildHeap - heapifyUp

buildHeap - heapifyDown

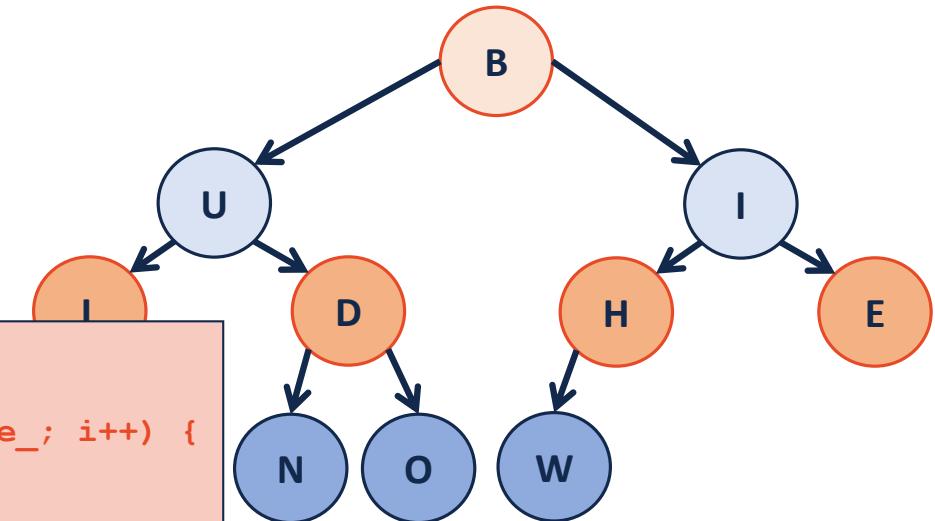

buildHeap

1. Sort the array – it's a heap!

- 2.

```
1 template <class T>
2 void Heap<T>::buildHeap() {
3     for (unsigned i = 2; i <= size_; i++) {
4         heapifyUp(i);
5     }
6 }
```

- 3.

```
1 template <class T>
2 void Heap<T>::buildHeap() {
3     for (unsigned i = parent(size); i > 0; i--) {
4         heapifyDown(i);
5     }
6 }
```

Proving buildHeap Running Time

Theorem: The running time of buildHeap on array of size n is: _____.

Strategy:

-
-
-

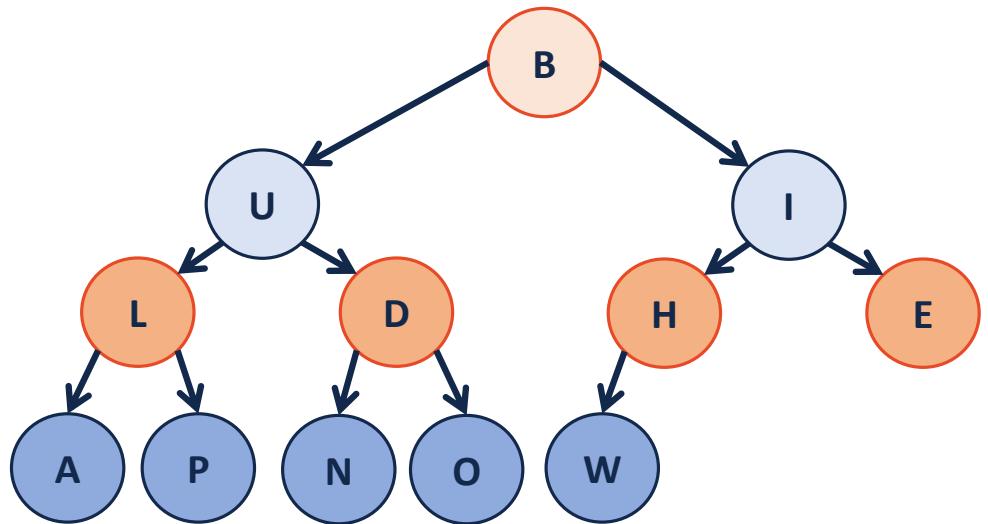

Proving buildHeap Running Time

$S(h)$: Sum of the heights of all nodes in a complete tree of height h .

$$S(0) =$$

$$S(1) =$$

$$S(h) =$$

Proving buildHeap Running Time

Proof the recurrence:

Base Case:

General Case:

Proving buildHeap Running Time

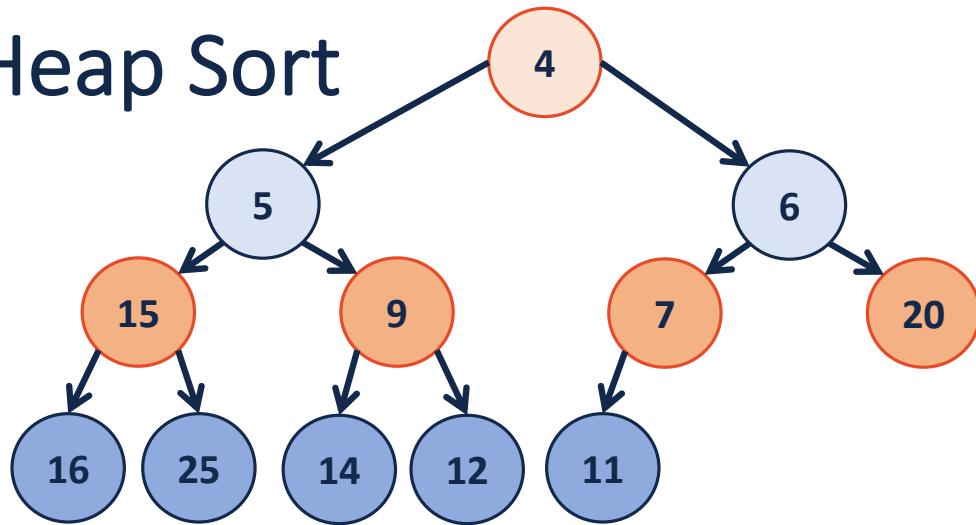

From $S(h)$ to $\text{RunningTime}(n)$:

$S(h)$:

Since $h \leq \lg(n)$:

$\text{RunningTime}(n) \leq$

Heap Sort

1.

2.

3.

Running Time?

Why do we care about another sort?
