CS 225 Honors Staff Introductions

Who are you?

Take a moment to introduce yourself to your neighbor!

(Your name, a hobby you enjoy, and one thing you hope to get out of this class)

Piazza Sign up Link: https://piazza.com/illinois/fall2024/cs199225

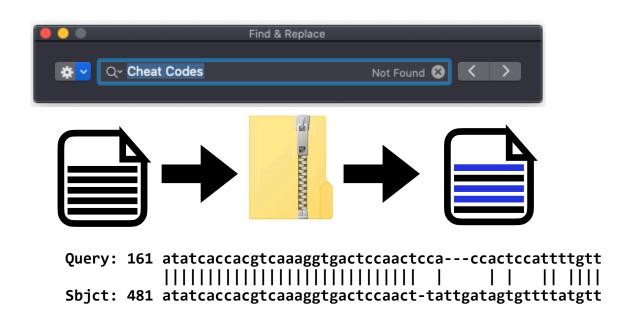

What is this class about?

Foundational
String Algorithms and Data Structures

Exact string matching

Compressed self-indexes

Inexact pattern matching

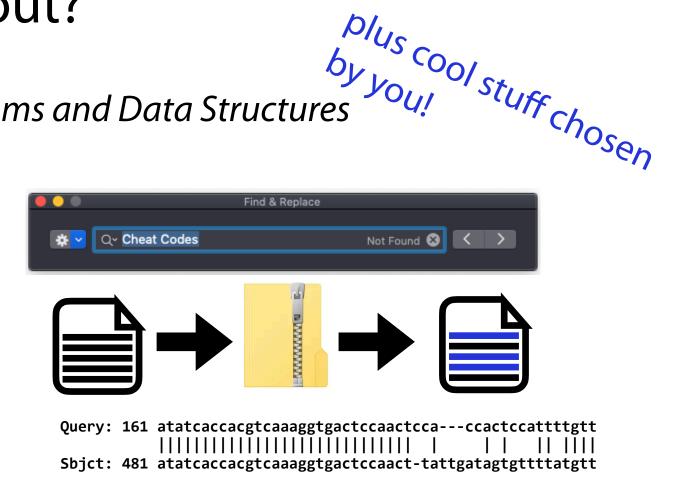

What is this class about?

String Algorithms and Data Structures

Exact string matching

Compressed self-indexes

Inexact pattern matching

What will you get out of this class?

Understand fundamental string algorithms

Experience applying data structures, algorithms, and algorithm design principles to real world problems

Justify implementation choices based on theoretical or practical considerations

Build a foundation for future data science projects

Syllabus

Syllabus

Please read — many important topics:

Course Goals & Topics

Course Expectations

Grading

Commitments to Diversity, Equity, Inclusion

Commitments to Mental Health

Ethics and Academic Integrity Policies

Course Expectations

Weekly assignments (11 total):

Small assignments (~ 1-3 hours / week)

Must pass at least 10 of them (80% is passing)

Must submit your own work

One week extensions for 80% credit

Course Expectations

Class participation:

No attendance grades

Ask questions (synchronously or asynchronously)

Participate in breakout rooms and polls

Mental Health

This class should be low-stress, light work-load.

UIUC offers a variety of confidential services:

Counseling Center: 217-333-3704

610 East John Street Champaign, IL 61820

McKinley Health Center: 217-333-2700

1109 South Lincoln Avenue, Urbana, Illinois 61801

Diversity, Equity, and Inclusion

"If you witness or experience racism, discrimination, micro-aggressions, or other offensive behavior, you are encouraged to bring this to the attention of..."

Learning Objectives

Review fundamentals of strings

Introduce exact pattern matching problem

What is a string?

String S is a finite sequence of characters

Characters are drawn from alphabet Σ , usually assumed finite

Nucleic acid alphabet: { A, C, G, T }

English: { A,B,C,D,E,F,G,H,I,J,K,L,M,N,O,P,Q,R,S,T,U,V,W,X,Y,Z }

What are some other alphabets we could use?

What is a string... in C++?

char: 1-byte (8-bit) character encoding [ASCII 256]

std::string: uses *char* alphabet (by default), has significant operation support

string_main.cpp

```
#include <string>
#include <iostream>

int main() {

char c[] = "Hello World";

std::string str = "Hello World";

return 0;

}
```

Fundamental operations

Math Strings

"How efficient is my algorithm at searching for a given pattern P?"

"How much memory do I need to allocate for this text file?"

Size of S, |S|: The number of characters in S.

```
S = "How big?"
```

$$|S| = ?$$

Size of S, |S|: The number of characters in S.

$$|S| = 8$$

0	1	2	3	4	5	6	7
Н	0	W		b	i	g	?

Size of S, |S|: The length of S (in terms of bytes).

S.length()

size.cpp

```
#include <string>
   #include <iostream>
   int main() {
      std::string S = "Is this a string?";
      std::string T = "No, this is Patrick.";
      std::cout << S.length() << std::endl;</pre>
      std::cout << T.length() << std::endl;</pre>
10
      return 0;
11
12
13
14
```

"Is this book about data structures?"

"Is this student enrolled at UIUC?"

S **equals** T if each character, in order, is the same

```
S == T
```

equals.cpp

```
#include <string>
   #include <iostream>
   int main() {
     std::string S = "Thing 1";
     std::string T = "Thing 1";
     if (S == T) {
     std::cout << "S == T" << std::endl;
    } else {
10
       std::cout << "S != T" << std::endl;
11
12
    return 0;
13
14
```

S **equals** T if each character, in order, is the same

```
S == T
```

char_equals.cpp

```
#include <string>
   #include <iostream>
   int main() {
     char S[] = "Thing 1";
    char T[] = "Thing 1";
     if (S == T) {
     std::cout << "S == T" << std::endl;
    } else {
10
       std::cout << "S != T" << std::endl;
11
12
    return 0;
13
14
```

S **equals** T if each character, in order, is the same

```
S == T
```

char_equals.cpp

```
substring.cpp:8:9: warning: array comparison always evaluates to false [-Wtautological-compare]
     if (S == T){
    int main() {
      char S[] = "Thing 1";
      char T[] = "Thing 1";
      if (S == T) {
         std::cout << "S == T" << std::endl;
      } else {
10
         std::cout << "S != T" << std::endl;
11
12
     return 0;
13
14
```

"Is this book about data structures?"

S: Data Structures

1.1 Why Compact Data Structures?

Google's stated mission, "to organize the world's information and make it universally accessible and useful," could not better capture the immense ambition of modern society for gathering all kinds of data and putting them to use to improve our lives. We are collecting not only huge amounts of data from the physical world (astronomical, climatological, geographical, biological), but also human-generated data (voice, pictures, music, video, books, news, Web contents, emails, blogs, tweets) and society-based behavioral data (markets, shopping, traffic, clicks, Web navigation, likes, friendship

S is a **substring** of T if there exists (possibly empty) strings u and v such that T = uSv

A **substring** is a sequence of characters (a string) contained within another string

S: pepper

T: I_like_pepperoni_pizza

A **substring** of S is a string occurring inside S

```
S.substr(size_t pos, size_t len)
```

substring.cpp

```
#include <string>
#include <iostream>

int main() {
    std::string T = "Hello my name is ";

std::cout << T.substr(1,4) << std::endl;

return 0;
}</pre>
```

A **substring** of S is a string occurring inside S

```
S.substr(size_t pos, size_t len)
```

substring.cpp

```
#include <string>
#include <iostream>

int main() {
    std::string T = "Hello my name is ";

std::cout << T.substr(1,4) << std::endl;

return 0;
}</pre>
```

ring

Size, |S|

S.length()

Equals, S == T

S == T

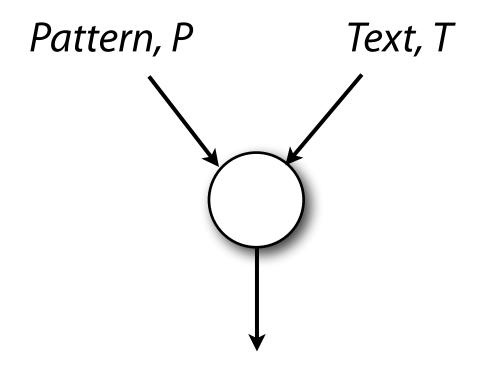

Concatenation, ST

S + T

Substring, uSv

S.substr(pos, len)

Exact Pattern Matching

Find instances of *P* in *T*

'instances': An exact, full length copy

Exact Pattern Matching

Find places where *pattern P* occurs as a substring of *text T*. Each such place is an *occurrence* or *match*.

```
P: word
```

T: There would have been a time for such a word Alignment 1: word Alignment 2: word

Not a match!

Match!

Alignment: a way of putting *P's* characters opposite *T's*. May or may not correspond to a match.

Exact Pattern Matching

What's a simple algorithm for exact matching?

P: word

occurrence

Try all possible alignments. For each, check if it matches. This is the *naïve algorithm*.

Assignment 1: a_naive

Learning Objective:

Conceptualize exact pattern matching w/ naïve search

Demonstrate understanding of fundamental operations

Think about as you code: is naïve search a good solution?

How can we improve the naïve algorithm?

How can we improve the naïve algorithm?

... if you have infinite space?

How can we improve the naïve algorithm?

... if I tell you the pattern ahead of time?

How can we improve the naïve algorithm?

... if I tell you the text ahead of time?

How can we improve the naïve algorithm?

... if you have infinite space?

... if I tell you the pattern ahead of time?

... if I tell you the text ahead of time?
