

Returning from a function

Identical to passing into a function, we also have three choices on how memory is used when returning from a function:

Return by value:

```
15 Sphere joinSpheres(const Sphere &s1, const Sphere &s2)
```

Return by reference:

```
15 Sphere &joinSpheres(const Sphere &s1, const Sphere &s2)
```

...remember: never return a reference to stack memory!

Return by pointer:

```
15 Sphere *joinSpheres(const Sphere &s1, const Sphere &s2)
```

...remember: never return a reference to stack memory!

Copy Constructor

When a non-primitive variable is passed/returned **by value**, a copy must be made. As with a constructor, an automatic copy constructor is provided for you if you choose not to define one:

All **copy constructors** will:

The **automatic copy constructor**:

- 1.
- 2.

To define a **custom copy constructor**:

```

sphere.h
5 class Sphere {
6   public:
7     Sphere();           // default ctor
8     Sphere(double r);  // 1-param ctor
9     Sphere(const Sphere & other); // custom copy ctor
10    ...

```

Bringing Concepts Together:

How many times do our different joinSphere files call each constructor?

	By Value	By Pointer	By Reference
Sphere()			
Sphere(double)			
Sphere(const Sphere &)			

```

joinSpheres- {byValue,byReference,byPointer}.cpp
15 Sphere joinSpheres(Sphere s1, Sphere s2) {
16   double totalVolume = s1.getVolume() + s2.getVolume();
17
18   double newRadius = std::pow(
19     (3.0 * totalVolume) / (4.0 * 3.141592654),
20     1.0/3.0
21   );
22
23   Sphere result(newRadius);
24
25   return result;
26 }

```

A Sphere, A Universe.

Consider a Universe of three Spheres:

```

Universe.h
1 #ifndef UNIVERSE_H_
2 #deifne UNIVERSE_H_
3
4 #include "Sphere.h"
5 using namespace cs225;
6
7 class Universe {
8   public:
9     Universe();           // default ctor
10    Universe(Sphere s, Sphere *q, Sphere &r); // 3-param
11    Universe(const Universe & other);
12    // ...
13   private:
14     Sphere p_, *q_, &r;
15 };
16
17 #endif

```

Automatic Copy Constructor Behavior:

The behavior of the automatic copy constructor is to make a copy of every variable. We can mimic this behavior in our Universe class:

```

Universe.cpp
10 Universe::Universe(const Universe & other) {
11     p_ = other.p_;
12     q_ = other.q_;
13     r_ = other.r_;
14 }
    
```

...we refer to this as a _____ because:

Deep Copy via Custom Copy Constructor:

Alternatively, a custom copy constructor can perform a deep copy:

```

Universe.cpp
16 Universe::Universe(const Universe & other) {
17     // Deep copy p_:
18
19
20
21     // Deep copy q_:
22
23
24
25     // Deep copy r_:
26
27
28
29 }
    
```

Destructor

The last and final member function called in the lifecycle of a class is the destructor.

Purpose of a **destructor**:

The **automatic destructor**:

- 1.
- 2.

Custom Destructor:

```

sphere.h
5 class Sphere {
6     public:
7         Sphere();           // default ctor
8         Sphere(double r);  // 1-param ctor
9         Sphere(const Sphere & other); // custom copy ctor
10        ~Sphere();          // destructor, or dtor
11        ...
    
```

Overloading Operators

C++ allows custom behaviors to be defined on over 20 operators:

Arithmetic	+ - * / % ++ --
Bitwise	& ^ ~ << >>
Assignment	=
Comparison	== != > < >= <=
Logical	! &&
Other	[] () ->

General Syntax:

Adding overloaded operators to Sphere:

sphere.h	sphere.cpp
1 #ifndef SPHERE_H	... /* ... */
2 #define SPHERE_H	10
3	11
4 class Sphere {	12
5 public:	13
6 // ...	14
7	15
8	16
9	17
10	18
11	19
12	20
13	21
14	22
15	23
16	24
17	25
18	26
19	27
20	28
21	29

CS 225 – Things To Be Doing:

1. Theory Exam #1 Starts Tomorrow (Register in the CBTF)
2. MP1 due tonight; grace period until Tuesday @ 11:59pm
3. MP2 released on Tuesday (*start early for extra credit!*)
4. Lab Extra Credit → Attendance in your registered lab section!
5. Daily POTDs every M-F for daily extra credit!
