CS 241 Fall 2013

Midterm Exam Study Guide

C Programming

- 1. What is POSIX?
- 2. Explain the difference between a library function and a system call.
- 3. Give an example of a POSIX system call used in CS241 lectures or reading.
- 4. How does pointer arithmetic work?
- 5. What is the * operator? What does it do? What is the & operator? What does it do?
- 6. How do you define a function pointer?
- 7. What is a String? What is NULL?
- 8. What is the difference between strlen() and sizeof()?
- 9. What's the difference between a stack and a heap variable? What about global and static variables?
- 10. When is a stack full?
- 11. How does malloc() and free() work?
- 12. What is the difference between a string and a string literal?
- 13. How do strcpy(), strcat(), and strncat() work?

Memory

- 14. What is the difference between physical and virtual memory?
- 15. What is a page fault?
- 16. What operations occur for every page fault? What operations occur only for some page faults?
- 17. What are the different memory allocation selection algorithms and what are the advantages of each?
- 18. How are virtual addresses translated to physical addresses in multi-level page tables? Given a virtual address and the physical page number, can you write code to translate the virtual address to a physical address?
- 19. How do page size and the number of levels of page tables affect the number of entries in a page table?
- 20. What is a page table entry? What is contained in each PTE?
- 21. What is the purpose of the Present (P), Dirty (D), Read-Write (RW), Not Execute (NX), and Accessed (A) bits?
- 22. What are the page eviction algorithms?
- 23. What is the difference between internal and external fragmentation?
- 24. What are the different page replacement policies and the advantages of each?
- 25. Describe how the buddy system works and the run time for different operations.
- 26. What is thrashing? When does it occur?
- 27. What causes a SEGFAULT and what happens when one occurs?
- 28. When is a process swapped out to disk?
- 29. Name three benefits of virtual memory (as opposed to allowing programs to directly access physical memory).
- 30. Name one advantage of segmentation over paging, and one advantage of paging over segmentation.

- 31. Assuming a 32-bit address space and 4 KB pages, what is the virtual page # and offset for virtual address 0xd34f6a5?
- 32. Give an example of a page fault that is an error, and an example of a page fault that is not an error.
- 33. Suppose we have a 64-bit address space and 16 KB pages. How big is the page table of a single process? What is the problem here? How would multi-level page tables help solve this problem?
- 34. Which scheme is better: OPT or LRU? Why?
- 35. How does the virtual memory subsystem know the exact location where a particular page is stored on disk, if it is swapped out of memory?
- 36. Compare and contrast (give one benefit and one disadvantage) for: implicit, explicit, segregated, and buddy free lists.

Threads and Processes

- 37. Which resources are shared between threads of the same process? Which are not shared?
- 38. Write a simple program using pthread_create(). What is the possible output of your code?
- 39. X is a global variable and initially X = 0. What are the possible values for X after two threads both try to increment X?
- 40. What happens when a thread calls exit()?
- 41. What happens to a process's resources when it terminates normally?
- 42. Describe what happens when a process calls fork().
- 43. Under what conditions would a process exit?
- 44. Explain the actions needed to perform a process context switch.
- 45. Explain the actions needed to perform a thread context switch.
- 46. Compare the use of fork() to the use of pthread_create().
- 47. In a multiprocessor system, what conditions will cause threads within a process to block?
- 48. Explain how a process can become orphaned and what the OS does with it. How about zombies?
- 49. Describe how to use the POSIX call wait().
- 50. Explain what happens when a process calls exec().
- 51. Why are some functions not thread safe?
- 52. If a process spawns a number of threads, in what order will these threads run?
- 53. Explain how to use pthread join() and why it is used.
- 54. Explain how a shell process can execute a different program.
- 55. Explain how one process can wait on the return value of another process.
- 56. Describe the transitions between running, ready and blocked in the 5 state model.

Scheduling

- 57. Which policies have the possibility of resulting in the starvation of processes?
- 58. Which scheduling algorithm results the smallest average wait time?
- 59. What scheduling algorithm has the longest average response time?
- 60. Define turnaround time, waiting time and response time in the context of scheduling algorithms?
- 61. Why do processes need to be scheduled?
- 62. What is starvation?
- 63. What is response time? What other metrics do we use to evaluate scheduling algorithms?
- 64. Which scheduling algorithm minimizes average initial response time? Waiting time? Turnaround time?
- 65. Why are SJF and Preemptive SJF hard to implement in real systems?
- 66. What does it mean to preempt a process?

- 67. What does it mean for a scheduling algorithm to be preemptive?
- 68. Describe the Round-Robin scheduling algorithm. Explain the performance advantages and disadvantages.
- 69. Describe the First Come First Serve (FCFS) scheduling algorithm. Explain the performance advantages and disadvantages.
- 70. Describe the Pre-emptive and Non-preemptive SJF scheduling algorithms. Explain the performance advantages and disadvantages.
- 71. Describe the Preemptive Priority-based scheduling algorithm. Explain the performance advantages and disadvantages.
- 72. How does the length of the time quantum affect Round-Robin scheduling?
- 73. Define fairness in terms of scheduling algorithms. What is the fairness properties of each of the scheduling disciplines discussed in class?
- 74. Which scheduling algorithms guarantee progress?
- 75. A process was switched from running to ready state. Describe the characteristics of the scheduling algorithm being used.
- 76. Which properties of scheduling algorithms affect the performance of interactive systems?

Semaphores / Mutexes

- 77. When do you have to use a semaphore or mutex?
- 78. What is mutual exclusion?
- 79. How can use use a mutex lock to ensure that concurrent code operates correctly?
