### Algorithms and Data Structures for Data Science Graphs

CS 277 Brad Solomon March 20, 2024

**Department of Computer Science** 

### Learning Objectives

Define graph vocabulary

Discuss graph implementation / storage strategies

Define key graph functions and discuss implementation details

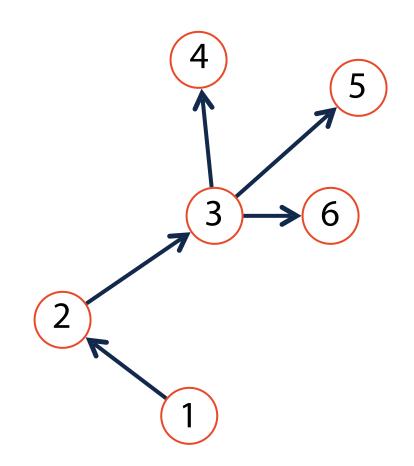

### Whats next?

A non-linear data structure defined recursively as a collection of nodes where each node contains a value and zero or more connected nodes.

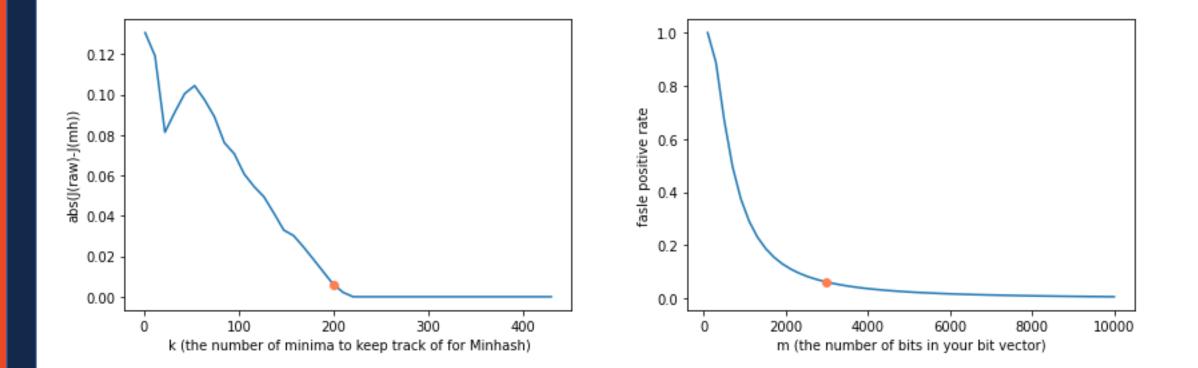

(In CS 277) a tree is also:

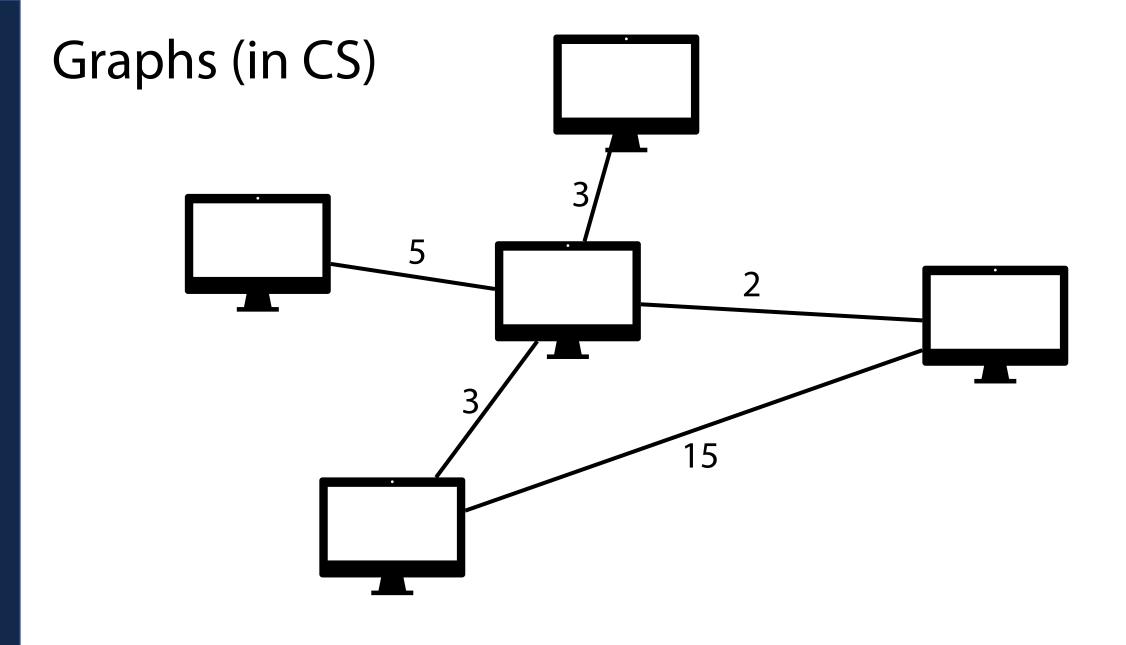

1) Acyclic — contains no cycles

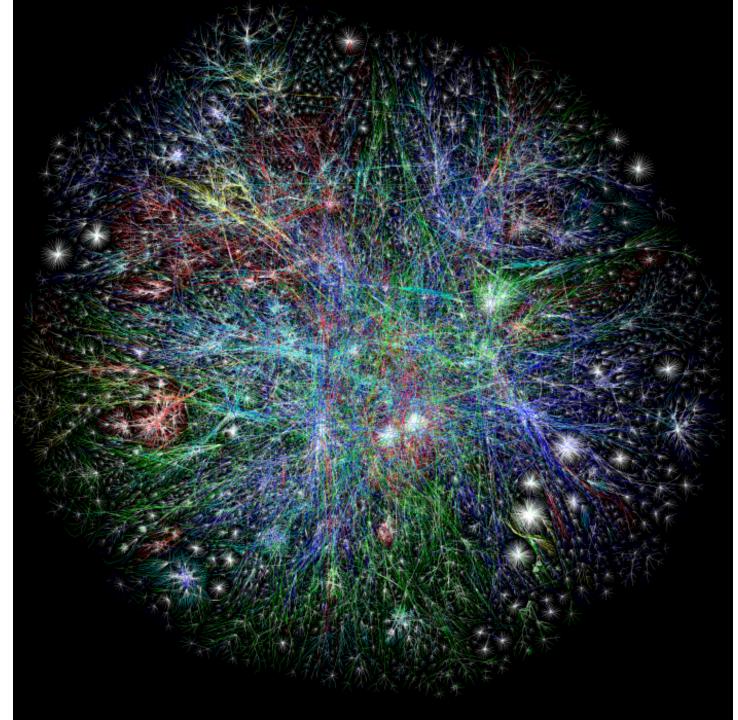

2) Rooted — root node connected to all nodes

### Graphs (for most people)

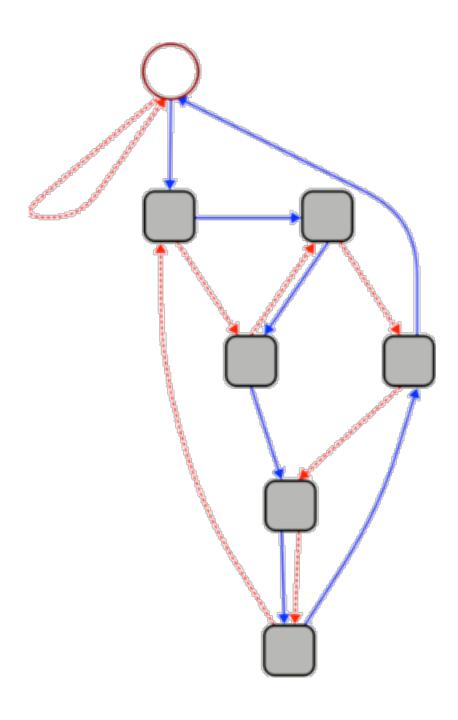

**Nodes:** Routers and servers

### **Edges:** Connections

The Internet 2003
<u>The OPTE Project (</u>2003)

This graph can be used to quickly calculate whether a given number is divisible by 7.

1. Start at the circle node at the top.

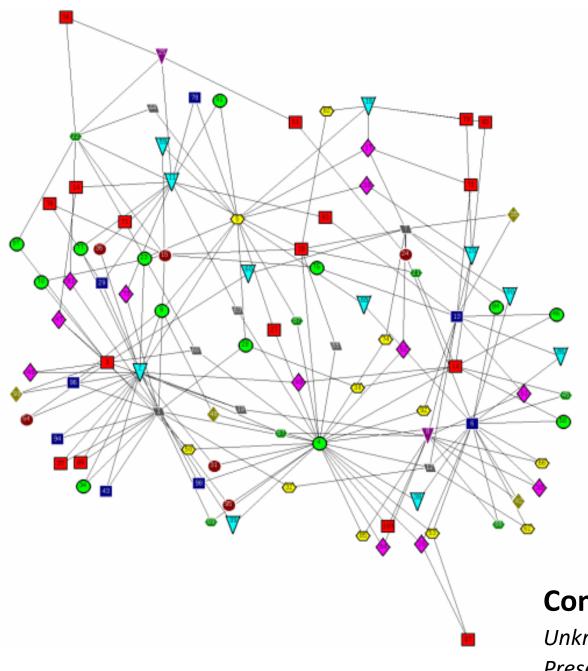

2. For each digit d in the given number, follow
d blue (solid) edges in succession. As you
move from one digit to the next, follow 1 red
(dashed) edge.

3. If you end up back at the circle node, your number is divisible by 7.

3703

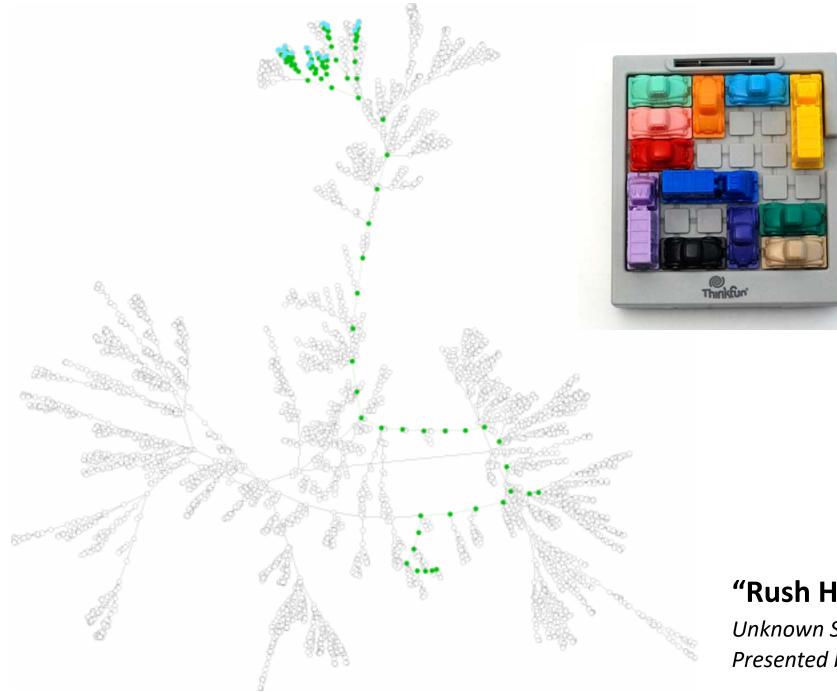

### "Rule of 7"

### **Conflict-Free Final Exam Scheduling Graph**

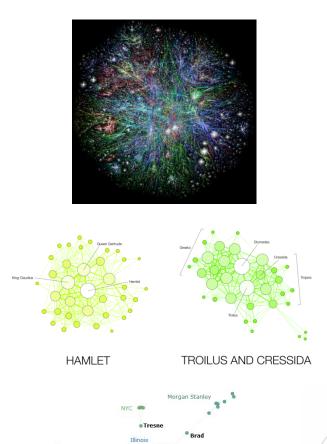

Unknown Source Presented by Cinda Heeren, 2016

### "Rush Hour" Solution

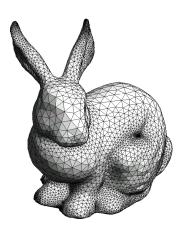

Unknown Source Presented by Cinda Heeren, 2016

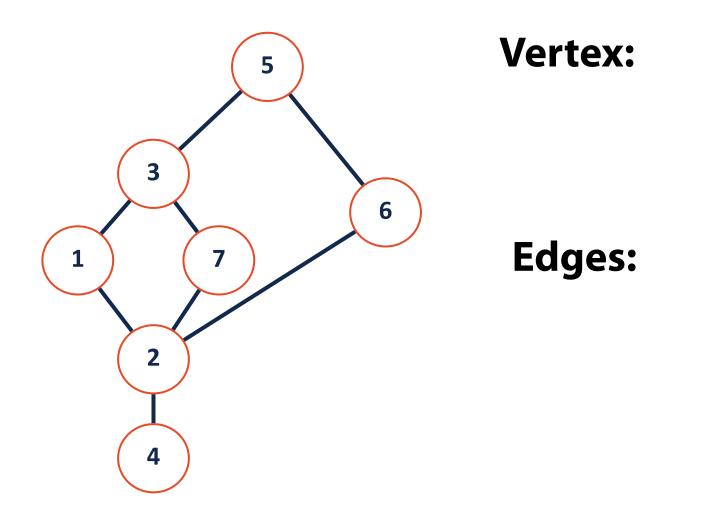

### To study all of these structures:

- 1. A common vocabulary
- 2. Graph implementations
- 3. Graph traversals
- 4. Graph algorithms

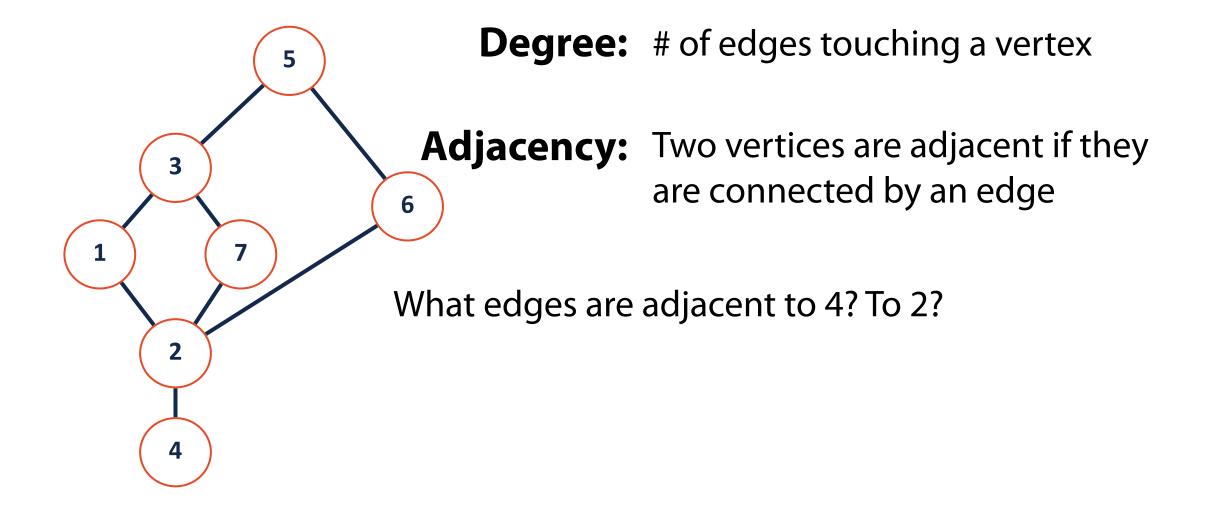

G = (V, E)

A graph is a data structure containing a set of vertices and a set of edges

Each vertex can have many edges

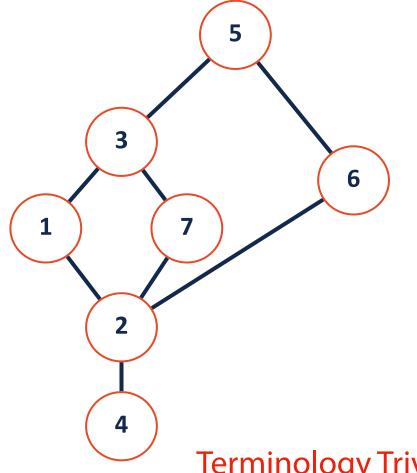

A graph has **no root** and **may contain cycles** 

**Path:** A sequence of vertices (or edges) between two nodes

What is a path between 4 and 3?

Terminology Trivia: Every tree is a graph but not every graph is a tree

A graph has **no root** and **may contain cycles** 

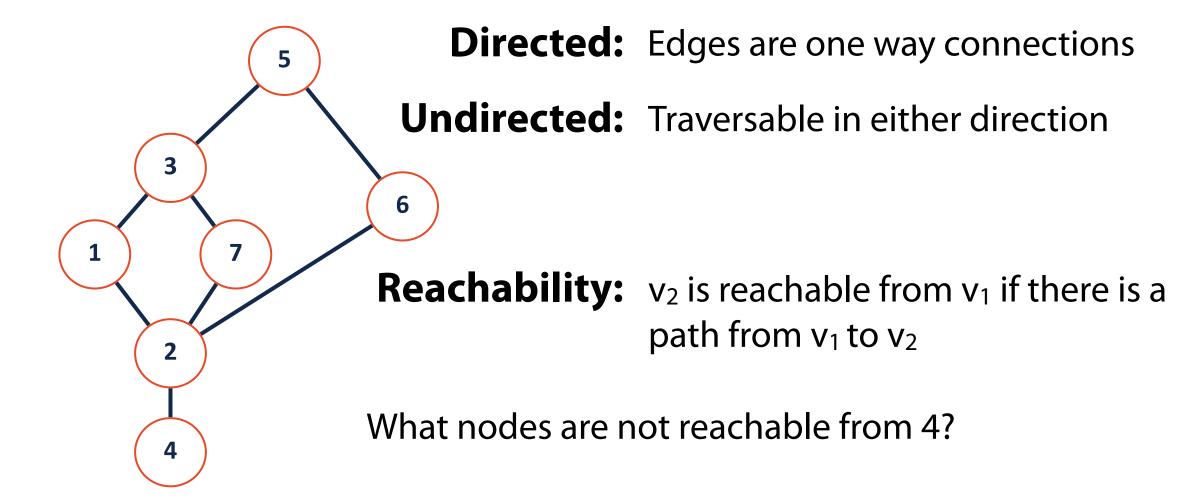

**Cycle:** A path from a node back to itself

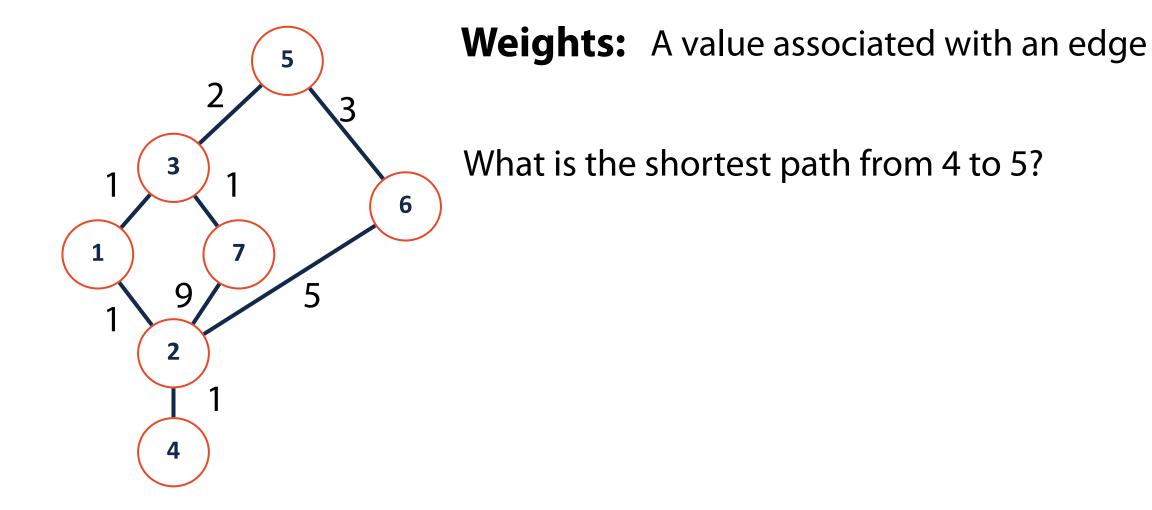

What are some of the cycles in this graph?

Terminology Trivia: Every tree is a graph but not every graph is a tree

A graph may be **directed** or **undirected** 

A graph may be **weighted** or **unweighted** 

Given a collection of individual DMs between individuals, you want to build a graph of connections in a social network.

What is a vertex?

What is an edge?

Are the edges directed or undirected?

Are the edges weighted or unweighted?

Given a collection of roads between cities in Illinois, you want to build a graph of the transportation infrastructure in the state. What is a vertex?

What is an edge?

Are the edges directed or undirected?

Are the edges weighted or unweighted?

It is important to be able to describe the structure of a graph given input.

Some other common questions:

Does your graph have cycles?

What is the largest / smallest / average degree in your graph?

What is the total number of edges?

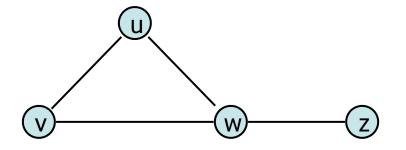

• • •

Of course, we also have to understand the graph as a **data structure** 

## **Graph Implementation**

What information do we need to store to fully define a graph?

Vertex:

Edge:

What information do we want to be able to find out quickly?

What operations do we want to prioritize?

# Graph ADT

### Graph ADT

### Constructor

Find: Need to be able to search for vertices, edges, and adjacency.

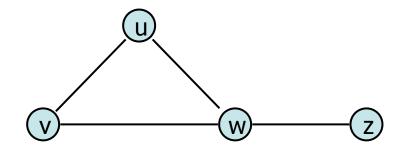

**Insert:** Need both a vertex and an edge insertion function

**Remove:** Need both a vertex and an edge removal function

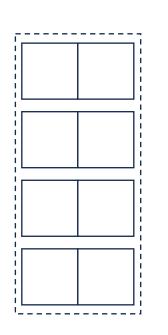

Traversal: Need to be able to traversal a graph efficiently

## Graph Implementation: Edge List |V| = n, |E| = m

The equivalent of an 'unordered' data structure

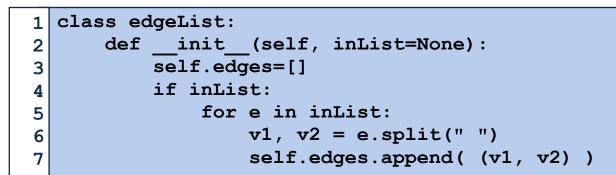

**Vertex Storage:** 

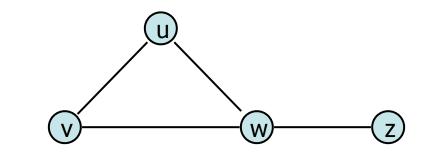

**Edge Storage:** 

## Graph Implementation: Edge List |V| = n, |E| = m

The equivalent of an 'unordered' data structure

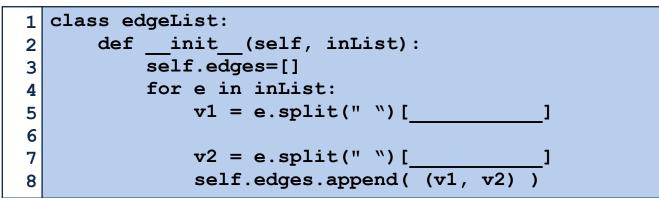

Most graph inputs are line separated lists of edges:

u v u w v w w z

# Graph Implementation: Edge List |V| = n, |E| = m

### The equivalent of an 'unordered' data structure

#### Airline

2-letter (IATA) or 3-letter (ICAO) code of the airline.

#### **Airline ID**

Unique OpenFlights identifier for airline (see Airline).

#### Source airport

3-letter (IATA) or 4-letter (ICAO) code of the source airport.

#### Source airport ID

Unique OpenFlights identifier for source airport (see Airport)

#### **Destination airport**

3-letter (IATA) or 4-letter (ICAO) code of the destination airport.

#### **Destination airport ID**

Unique OpenFlights identifier for destination airport (see Airport)

#### Codeshare

"Y" if this flight is a codeshare (that is, not operated by Airline, but another carrier), empty otherwise.

#### Stops

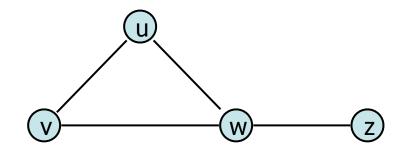

Number of stops on this flight ("0" for direct)

#### Equipment

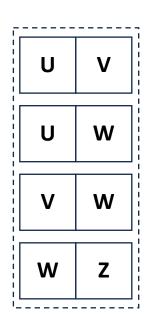

3-letter codes for plane type(s) generally used on this flight, separated by spaces

### Graph Implementation: Edge List

getVertices()

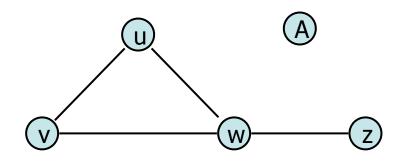

getEdges(v)

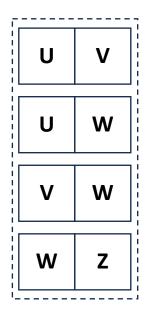

### areAdjacent(u, v)

## Graph Implementation: Edge List

insertVertex(v)

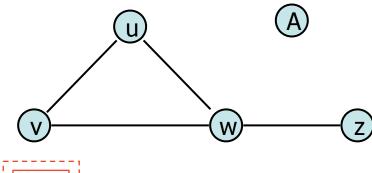

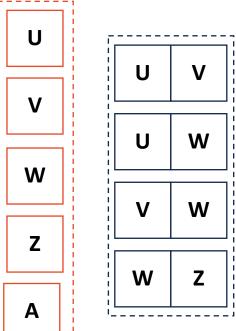

insertEdge(u, v)

## Graph Implementation: Edge List

insertVertex(v)

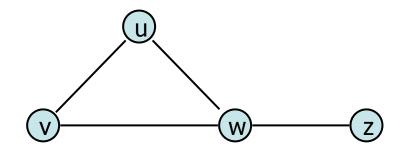

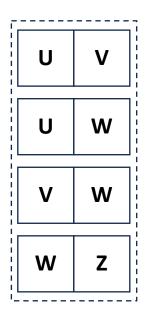

insertEdge(u, v)

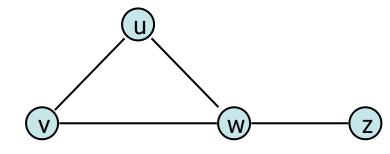

### Graph Implementation: Edge List Pros:

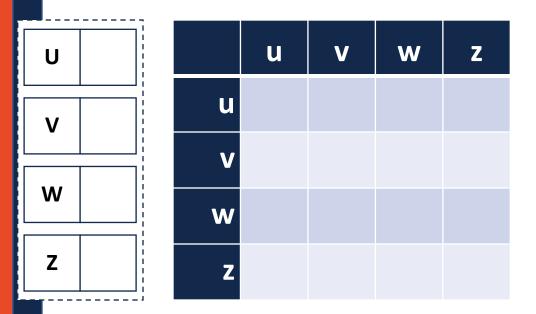

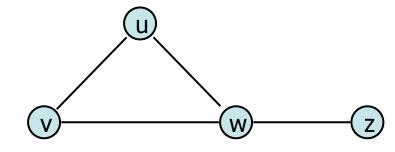

**Cons:** 

**Vertex Storage:** 

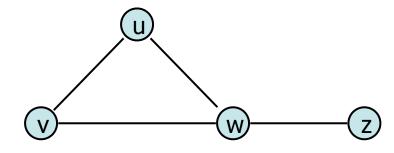

**Edge Storage:** 

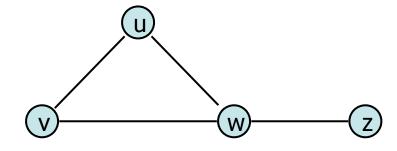

getVertices():

U	0		u	v	w	z
v	1	u	0	1	1	0
		v	1	0	1	0
W	2	w	1	1	0	1
Z	3	Z	0	0	1	0

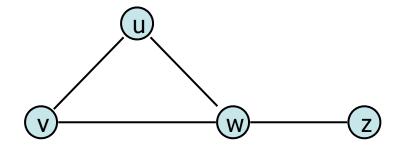

getEdges(v):

U	0		u	v	w	Z
v	1	u	0	1	1	0
		v	1	0	1	0
W	2	w	1	1	0	1
z	3	Z	0	0	1	0

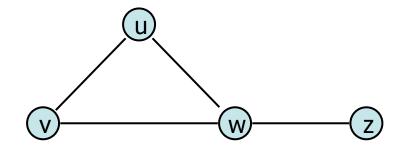

### areAdjacent(u, v):

U	0		u	v	w	z
v	1	u	0	1	1	0
		V	1	0	1	0
W	2	w	1	1	0	1
z	3	Z	0	0	1	0

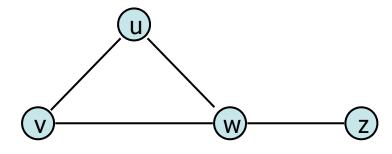

insertVertex(v):

U	0		u	v	W	Z
v	1	ι	0	1	1	0
		N N	1	0	1	0
W	2	W	1	1	0	1
z	3	2	0	0	1	0

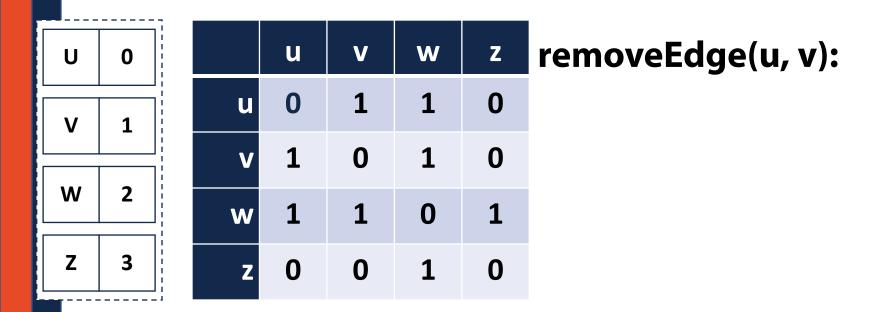

insertEdge(u, v):

U	0		u	v	w	Z
v	1	u	0	1	1	0
		v	1	0	1	0
W	2	w	1	1	0	1
z	3	z	0	0	1	0

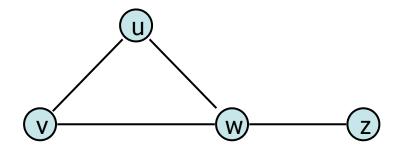

removeVertex(v):

**Pros:** 

**Cons:** 

U	0		u	v	w	Z
v	1	u	0	1	1	0
		v	1	0	1	0
W		w	1	1	0	1
Z	3	z	0	0	1	0
