

Data Structures for Heap Management

When we manage heap memory, we need to use memory to help us store memory:

- Overhead:
- Allocated Memory:

Metadata-based Approach to Memory Storage

06/heap.c	
<pre> 5 int *a = malloc(4096); 6 printf("a = %p\n", a); 7 free(a); 8 9 int *b = malloc(4096); 10 printf("b = %p\n", b); 11 12 int *c = malloc(4096); 13 printf("c = %p\n", c); 14 15 int *d = malloc(4096); 16 printf("d = %p\n", d); 17 18 free(b); 19 free(c); 20 21 int *e = malloc(5000); 22 printf("e = %p\n", e); 23 24 int *g = malloc(10); 25 printf("g = %p\n", g); 26 27 int *g = malloc(10); 28 printf("g = %p\n", g); </pre>	<p>Heap w/ Data Structures: <i>(Without reuse after free)</i></p> <div style="border: 1px solid black; height: 150px; width: 100%;"></div>

Pages in Cache – Eviction/Replacement Strategies:

We know that memory is divided into pages, a page table provides a translation between virtual page numbers and physical pages, and that we allocate memory via malloc. How do we decide what pages to cache?

Strategy #1:

	17	33	40	17	43	8	99	33	99	17
C										
A										
C										
H										
E										

Strategy #2:

	17	33	40	17	43	8	99	33	99	17
C										
A										
C										
H										
E										

Strategy #3:

	17	33	40	17	43	8	99	33	99	17
C										
A										
C										
H										
E										

Strategy #4:

	17	33	40	17	43	8	99	33	99	17
C										
A										
C										
H										
E										

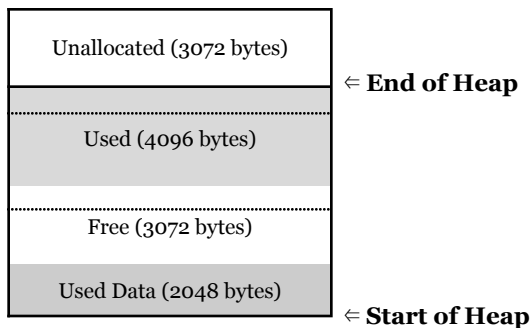

Other Strategies:

Fragmentation

As we develop various systems for storage, we want to minimize **fragmentation**.

- [Fragmentation]:
- [Internal Fragmentation]:
- [External Fragmentation]:

Fragmentation Example in Heap Memory:

Abstraction #4: Computer Peripherals

- Every other piece of hardware we consider to be a “peripheral”.
- Interface managed by the _____.
 - ...and managed using _____.
- Examples:

Threads: The Unit of Computation in an Operating System

As a programmer, the single most important construct in an Operating System is a thread.

- Every thread has a **program counter**, a pointer that stores the next instruction to be read by a program.
- A _____ is an organization of one or more threads in the same context. A simple process has only one thread.
- In C, the initial thread is called the _____.
 - It is what starts running your main() function!

Example: Launching Fifteen Threads

```
07/fifteen-threads.c
3 #include <pthread.h>
4
5 const int num_threads = 15;
6
7 void *thread_start(void *ptr) {
8     int id = *((int *)ptr);
9     printf("Thread %d running...\n", id);
10    return NULL;
11 }
12
13 int main(int argc, char *argv[]) {
14     // Create threads:
15     int i;
16     pthread_t tid[num_threads];
17     for (i = 0; i < num_threads; i++) {
18         pthread_create(&tid[i], NULL,
19                       thread_start, (void *)&i);
20     }
21     printf("Done!\n");
22     return 0;
23 }
```
