

Threads vs. Processes

Up until now, we've discussed **threads** -- the fundamental unit of computation -- and we know they're organized into **processes**.

- Threads within a process share nearly **all** resources (exceptions are few, like the PC and their stack frames).
AND
- Processes are almost _____ from other processes.

	Threads	Processes
Creation		
Overhead		
Context Switching		
Virtual Memory		

Case Study: Chrome

-

Inter-Process Communication (IPC)

IPC is the broad terminology for all technologies that facilitate real-time communication between processes.

Approach #1: _____

Using a pipe within a terminal:

```
$ ps -aux | grep waf
```

Creating pipes in C:

```
int pipe(int pipefd[2]);
```

Approach #2: _____

Approach #3: _____

Sending a signal within a terminal:

```
$ kill -TERM <pid>
```

Listing all available signals:

```
$ kill -l
```

Sending a signal in C:

```
int kill(pid_t pid, int sig);
```

Approach 4: _____

Allocating shared memory in C ("malloc for shared memory"):

```
void *mmap(void *addr, size_t length, int prot, int flags, int fd, off_t offset);
```

Approach 5: _____

Functions in C:

```
mqd_t mq_open(const char *name, int oflag);
int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len, unsigned int msg_prio);
ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len, unsigned int *msg_prio);
int mq_close(mqd_t mqdes);
```

Approach 6: _____

Approach 7: _____

Creating a new socket interface, returns a **file descriptor**:

```
int socket(int domain, int type, int protocol);
```

Binding a socket interface to an address and port:

```
int bind(int sockfd, const struct sockaddr *addr, socklen_t addrlen);
```

Connecting to a remote socket:

```
int connect(int sockfd, const struct sockaddr *addr, socklen_t addrlen);
```

Begin listening for a remote socket connection:

```
int listen(int sockfd, int backlog);
```

Start a new socket channel with a remote host:

```
int accept(int sockfd, struct sockaddr *restrict addr, socklen_t *restrict addrlen);
```

High Level Overview of Sockets

At the core of socket-based IPC, you have a _____ coming from a “remote host”.

- _____:
- _____:
- Port Number:

Server	Client
cs340-adm.cs.illinois.edu:34000	

11/socket.c

```
40 int main() {
43 // socket:
44 int sockfd = socket(AF_INET, SOCK_STREAM, 0);
...
48 // bind:
54 if ( bind(sockfd,
           (const struct sockaddr *)&server_addr,
           sizeof(server_addr)) != 0) { [...]
...
60 // listen:
61 if (listen(sockfd, 10) != 0) { [...]
...
67 // continue to accept new connections forever:
68 while (1) {
72 // accept:
73 int *fd = malloc(sizeof(int));
74 *fd = accept(sockfd, (struct sockaddr *)&client_address,
               &client_addr_len);
...
80 pthread_create(&tid, NULL, client_communication_thread, fd);
81 }
84 }

10 void *client_communication_thread(void *vptr_fd) {
11 int fd = *((int *)vptr_fd);
12 char buffer[4096];
13
14 while (1) {
15 // recv message:
16 ssize_t len = recv(fd, buffer, 4096, 0);
23 buffer[len] = '\0';
24
25 printf("[%d]:  recv(): ", fd);
...
32 // send response:
33 sprintf(buffer, "Your %ld bytes were received, thank you for
sending them!\n", len);
34 send(fd, buffer, strlen(buffer), 0);
35 }
```

Simple Socket Communication: telnet

The Linux utility **telnet** provides simple socket communications by sending all data you enter directly over the socket:

```
$ telnet cs340-adm.cs.illinois.edu 34000
```

(To exit, press **Ctrl+]** to go into command mode; then type **quit.**)
