# Part I

## (Polynomial Time) Reductions

# Reductions

Reduction from Problem **X** to Problem **Y** means (informally) that if we have an algorithm for Problem **Y**, we can use it to find an algorithm for Problem **X**.

## Using Reductions

- 1 We use reductions to find algorithms to solve problems.

# Reductions

Reduction from Problem  $X$  to Problem  $Y$  means (informally) that if we have an algorithm for Problem  $Y$ , we can use it to find an algorithm for Problem  $X$ .

## Using Reductions

- 1 We use reductions to find algorithms to solve problems.

# Reductions

Reduction from Problem  $X$  to Problem  $Y$  means (informally) that if we have an algorithm for Problem  $Y$ , we can use it to find an algorithm for Problem  $X$ .

## Using Reductions

- 1 We use reductions to find algorithms to solve problems.
- 2 We also use reductions to show that we **can't** find algorithms for some problems. (We say that these problems are **hard**.)

# Reductions for decision problems/languages

For languages  $L_X, L_Y$ , a *reduction from  $L_X$  to  $L_Y$*  is:

- 1 An algorithm ...
- 2 Input:  $w \in \Sigma^*$
- 3 Output:  $w' \in \Sigma^*$
- 4 Such that:

$$\boxed{w \in L_Y} \iff \boxed{w' \in L_X}$$

(Actually, this is only one type of reduction, but this is the one we'll use most often.) There are other kinds of reductions.

# Reductions for decision problems/languages

For languages  $L_X, L_Y$ , a *reduction from  $L_X$  to  $L_Y$*  is:

- 1 An algorithm ...
- 2 Input:  $w \in \Sigma^*$
- 3 Output:  $w' \in \Sigma^*$
- 4 Such that:

$$\boxed{w \in L_Y} \iff \boxed{w' \in L_X}$$

(Actually, this is only one type of reduction, but this is the one we'll use most often.) There are other kinds of reductions.

# Reductions for decision problems/languages

For decision problems  $X, Y$ , a *reduction from  $X$  to  $Y$*  is:

- 1 An algorithm ...
- 2 Input:  $I_X$ , an instance of  $X$ .
- 3 Output:  $I_Y$  an instance of  $Y$ .
- 4 Such that:

$I_Y$  is YES instance of  $Y$   $\iff$   $I_X$  is YES instance of  $X$

# Using reductions to solve problems

- 1  $\mathcal{R}$ : Reduction  $X \rightarrow Y$
- 2  $\mathcal{A}_Y$ : algorithm for  $Y$ :
- 3  $\implies$  New algorithm for  $X$ :

```
 $\mathcal{A}_X(I_X)$ :  
    //  $I_X$ : instance of  $X$ .  
     $I_Y \leftarrow \mathcal{R}(I_X)$   
    return  $\mathcal{A}_Y(I_Y)$ 
```

If  $\mathcal{R}$  and  $\mathcal{A}_Y$  polynomial-time  $\implies \mathcal{A}_X$  polynomial-time.

# Using reductions to solve problems

- 1  $\mathcal{R}$ : Reduction  $X \rightarrow Y$
- 2  $\mathcal{A}_Y$ : algorithm for  $Y$ :
- 3  $\implies$  New algorithm for  $X$ :

```
 $\mathcal{A}_X(I_X)$ :  
    //  $I_X$ : instance of  $X$ .  
     $I_Y \leftarrow \mathcal{R}(I_X)$   
    return  $\mathcal{A}_Y(I_Y)$ 
```

If  $\mathcal{R}$  and  $\mathcal{A}_Y$  polynomial-time  $\implies \mathcal{A}_X$  polynomial-time.

# Using reductions to solve problems

- 1  $\mathcal{R}$ : Reduction  $X \rightarrow Y$
- 2  $\mathcal{A}_Y$ : algorithm for  $Y$ :
- 3  $\implies$  New algorithm for  $X$ :

```
 $\mathcal{A}_X(I_X)$ :  
  //  $I_X$ : instance of  $X$ .  
   $I_Y \leftarrow \mathcal{R}(I_X)$   
  return  $\mathcal{A}_Y(I_Y)$ 
```

If  $\mathcal{R}$  and  $\mathcal{A}_Y$  polynomial-time  $\implies \mathcal{A}_X$  polynomial-time.

# Comparing Problems

- 1 If there is reduction from  $X$  to  $Y$ ...
- 2 "Problem  $X$  is no harder to solve than Problem  $Y$ ".
- 3 If Problem  $X$  reduces to Problem  $Y$  (we write  $X \leq Y$ ), then  $X$  cannot be harder to solve than  $Y$ .
- 4  $X \leq Y$ :
  - 1  $X$  is no harder than  $Y$ , or
  - 2  $Y$  is at least as hard as  $X$ .

# Part II

## Examples of Reductions

# Independent Sets and Cliques

Given a graph  $G$ , a set of vertices  $V'$  is:

# Independent Sets and Cliques

Given a graph  $G$ , a set of vertices  $V'$  is:

- 1 **independent set**: no two vertices of  $V'$  connected by an edge.

# Independent Sets and Cliques

Given a graph  $G$ , a set of vertices  $V'$  is:

- 1 **independent set**: no two vertices of  $V'$  connected by an edge.
- 2 **clique**: every pair of vertices in  $V'$  is connected by an edge of  $G$ .

# The **Independent Set** and **Clique** Problems

## Problem: **Independent Set**

**Instance:** A graph  $G$  and an integer  $k$ .

**Question:** Does  $G$  has an independent set of size  $\geq k$ ?

# The **Independent Set** and **Clique** Problems

## Problem: **Independent Set**

**Instance:** A graph  $G$  and an integer  $k$ .

**Question:** Does  $G$  has an independent set of size  $\geq k$ ?

## Problem: **Clique**

**Instance:** A graph  $G$  and an integer  $k$ .

**Question:** Does  $G$  has a clique of size  $\geq k$ ?

# Recall

For decision problems  $X$ ,  $Y$ , a reduction from  $X$  to  $Y$  is:

- 1 An algorithm ...
- 2 that takes  $I_X$ , an instance of  $X$  as input ...
- 3 and returns  $I_Y$ , an instance of  $Y$  as output ...
- 4 such that the solution (YES/NO) to  $I_Y$  is the same as the solution to  $I_X$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

Reduction given  $\langle G, k \rangle$  outputs  $\langle \bar{G}, k \rangle$  where  $\bar{G}$  is the *complement* of  $G$ .  $\bar{G}$  has an edge  $(u, v)$  if and only if  $(u, v)$  is **not** an edge of  $G$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

Reduction given  $\langle G, k \rangle$  outputs  $\langle \bar{G}, k \rangle$  where  $\bar{G}$  is the *complement* of  $G$ .  $\bar{G}$  has an edge  $(u, v)$  if and only if  $(u, v)$  is **not** an edge of  $G$ .

Independent set in  $G$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

Reduction given  $\langle G, k \rangle$  outputs  $\langle \bar{G}, k \rangle$  where  $\bar{G}$  is the *complement* of  $G$ .  $\bar{G}$  has an edge  $(u, v)$  if and only if  $(u, v)$  is **not** an edge of  $G$ .

Independent set in  $G$ .

Clique in  $\bar{G}$

# Correctness of reduction

## Lemma

$G$  has an independent set of size  $k$  if and only if  $\overline{G}$  has a clique of size  $k$ .

## Proof.

Need to prove two facts:

$G$  has independent set of size at least  $k$  implies that  $\overline{G}$  has a clique of size at least  $k$ .

$\overline{G}$  has a clique of size at least  $k$  implies that  $G$  has an independent set of size at least  $k$ .

Easy to see both from the fact that  $S \subseteq V$  is an independent set in  $G$  if and only if  $S$  is a clique in  $\overline{G}$ . □

# Independent Set and Clique

① **Independent Set**  $\leq$  **Clique**.

What does this mean?

② If we have an algorithm for **Clique**, then we have an algorithm for **Independent Set**.

③ **Clique** is *at least as hard as* **Independent Set**.

④ Also... **Clique**  $\leq$  **Independent Set**. Why? Thus **Clique** and **Independent Set** are polynomial-time equivalent.

# Independent Set and Clique

① **Independent Set**  $\leq$  **Clique**.

What does this mean?

② If have an algorithm for **Clique**, then we have an algorithm for **Independent Set**.

③ **Clique** is *at least as hard as* **Independent Set**.

④ Also... **Clique**  $\leq$  **Independent Set**. Why? Thus **Clique** and **Independent Set** are polynomial-time equivalent.

# Independent Set and Clique

① **Independent Set**  $\leq$  **Clique**.

What does this mean?

② If have an algorithm for **Clique**, then we have an algorithm for **Independent Set**.

③ **Clique** is *at least as hard as* **Independent Set**.

④ Also... **Clique**  $\leq$  **Independent Set**. Why? Thus **Clique** and **Independent Set** are polynomial-time equivalent.

# Independent Set and Clique

- 1 **Independent Set**  $\leq$  **Clique**.

What does this mean?

- 2 If have an algorithm for **Clique**, then we have an algorithm for **Independent Set**.
- 3 **Clique** is *at least as hard as* **Independent Set**.
- 4 Also... **Clique**  $\leq$  **Independent Set**. Why? Thus **Clique** and **Independent Set** are polynomial-time equivalent.

# Independent Set and Clique

Assume you can solve the **Clique** problem in  $T(n)$  time. Then you can solve the **Independent Set** problem in

- $O(T(n))$  time.
- $O(n \log n + T(n))$  time.
- $O(n^2 T(n^2))$  time.
- $O(n^4 T(n^4))$  time.
- $O(n^2 + T(n^2))$  time.
- Does not matter - all these are polynomial if  $T(n)$  is polynomial, which is good enough for our purposes.

# DFA Universality

A DFA  $M$  is **universal** if it accepts every string.  
That is,  $L(M) = \Sigma^*$ , the set of all strings.

Problem (**DFA universality**)

**Input:** A DFA  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **DFA Universality**?

We check if  $M$  has *any* reachable non-final state.

# DFA Universality

A DFA  $M$  is **universal** if it accepts every string.  
That is,  $L(M) = \Sigma^*$ , the set of all strings.

## Problem (**DFA universality**)

**Input:** A DFA  $M$ .

**Goal:** Is  $M$  universal?

How do we solve **DFA Universality**?

We check if  $M$  has *any* reachable non-final state.

# DFA Universality

A DFA  $M$  is **universal** if it accepts every string.  
That is,  $L(M) = \Sigma^*$ , the set of all strings.

## Problem (**DFA universality**)

**Input:** A DFA  $M$ .

**Goal:** Is  $M$  universal?

How do we solve **DFA Universality**?

We check if  $M$  has *any* reachable non-final state.

# DFA Universality

A DFA  $M$  is **universal** if it accepts every string.  
That is,  $L(M) = \Sigma^*$ , the set of all strings.

## Problem (**DFA universality**)

**Input:** A DFA  $M$ .

**Goal:** Is  $M$  universal?

How do we solve **DFA Universality**?

We check if  $M$  has *any* reachable non-final state.

# NFA Universality

An **NFA**  $N$  is said to be **universal** if it accepts every string. That is,  $L(N) = \Sigma^*$ , the set of all strings.

## Problem (**NFA universality**)

**Input:** A **NFA**  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **NFA Universality**?

Reduce it to **DFA Universality**?

Given an **NFA**  $N$ , convert it to an equivalent **DFA**  $M$ , and use the **DFA Universality** Algorithm.

The reduction takes **exponential time**!

**NFA Universality** is known to be PSPACE-Complete and we do not expect a polynomial-time algorithm.

# NFA Universality

An **NFA**  $N$  is said to be **universal** if it accepts every string. That is,  $L(N) = \Sigma^*$ , the set of all strings.

## Problem (**NFA universality**)

**Input:** A **NFA**  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **NFA Universality**?

Reduce it to **DFA Universality**?

Given an **NFA**  $N$ , convert it to an equivalent **DFA**  $M$ , and use the **DFA Universality** Algorithm.

The reduction takes **exponential time**!

**NFA Universality** is known to be PSPACE-Complete and we do not expect a polynomial-time algorithm.

# NFA Universality

An **NFA**  $N$  is said to be **universal** if it accepts every string. That is,  $L(N) = \Sigma^*$ , the set of all strings.

## Problem (**NFA universality**)

**Input:** A **NFA**  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **NFA Universality**?

Reduce it to **DFA Universality**?

Given an **NFA**  $N$ , convert it to an equivalent **DFA**  $M$ , and use the **DFA Universality** Algorithm.

The reduction takes **exponential time**!

**NFA Universality** is known to be PSPACE-Complete and we do not expect a polynomial-time algorithm.

# NFA Universality

An **NFA**  $N$  is said to be **universal** if it accepts every string. That is,  $L(N) = \Sigma^*$ , the set of all strings.

## Problem (**NFA universality**)

**Input:** A **NFA**  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **NFA Universality**?

Reduce it to **DFA Universality**?

Given an **NFA**  $N$ , convert it to an equivalent **DFA**  $M$ , and use the **DFA Universality** Algorithm.

The reduction takes **exponential time**!

**NFA Universality** is known to be PSPACE-Complete and we do not expect a polynomial-time algorithm.

# Polynomial-time reductions

We say that an algorithm is **efficient** if it runs in polynomial-time.

To find efficient algorithms for problems, we are only interested in **polynomial-time** reductions. Reductions that take longer are not useful.

If we have a polynomial-time reduction from problem  $X$  to problem  $Y$  (we write  $X \leq_P Y$ ), and a poly-time algorithm  $\mathcal{A}_Y$  for  $Y$ , we have a polynomial-time/efficient algorithm for  $X$ .

# Polynomial-time reductions

We say that an algorithm is *efficient* if it runs in polynomial-time.

To find efficient algorithms for problems, we are only interested in **polynomial-time** reductions. Reductions that take longer are not useful.

If we have a polynomial-time reduction from problem  $X$  to problem  $Y$  (we write  $X \leq_P Y$ ), and a poly-time algorithm  $\mathcal{A}_Y$  for  $Y$ , we have a polynomial-time/efficient algorithm for  $X$ .

# Polynomial-time reductions

We say that an algorithm is *efficient* if it runs in polynomial-time.

To find efficient algorithms for problems, we are only interested in **polynomial-time** reductions. Reductions that take longer are not useful.

If we have a polynomial-time reduction from problem  $X$  to problem  $Y$  (we write  $X \leq_P Y$ ), and a poly-time algorithm  $\mathcal{A}_Y$  for  $Y$ , we have a polynomial-time/efficient algorithm for  $X$ .

# Polynomial-time Reduction

A polynomial time reduction from a *decision* problem  $X$  to a *decision* problem  $Y$  is an *algorithm*  $\mathcal{A}$  that has the following properties:

- 1 given an instance  $I_X$  of  $X$ ,  $\mathcal{A}$  produces an instance  $I_Y$  of  $Y$
- 2  $\mathcal{A}$  runs in time polynomial in  $|I_X|$ .
- 3 Answer to  $I_X$  YES iff answer to  $I_Y$  is YES.

## Proposition

If  $X \leq_P Y$  then a polynomial time algorithm for  $Y$  implies a polynomial time algorithm for  $X$ .

Such a reduction is called a **Karp reduction**. Most reductions we will need are Karp reductions. Karp reductions are the same as mapping reductions when specialized to polynomial time for the reduction step.

# Reductions again...

Let  $X$  and  $Y$  be two decision problems, such that  $X$  can be solved in polynomial time, and  $X \leq_P Y$ . Then

- $Y$  can be solved in polynomial time.
- $Y$  can NOT be solved in polynomial time.
- If  $Y$  is hard then  $X$  is also hard.
- None of the above.
- All of the above.

# Polynomial-time reductions and hardness

For decision problems  $X$  and  $Y$ , if  $X \leq_P Y$ , and  $Y$  has an efficient algorithm,  $X$  has an efficient algorithm.

If you believe that **Independent Set** does not have an efficient algorithm, why should you believe the same of **Clique**?

Because we showed **Independent Set**  $\leq_P$  **Clique**. If **Clique** had an efficient algorithm, so would **Independent Set**!

If  $X \leq_P Y$  and  $X$  does not have an efficient algorithm,  $Y$  cannot have an efficient algorithm!

# Polynomial-time reductions and hardness

For decision problems  $X$  and  $Y$ , if  $X \leq_P Y$ , and  $Y$  has an efficient algorithm,  $X$  has an efficient algorithm.

If you believe that **Independent Set** does not have an efficient algorithm, why should you believe the same of **Clique**?

Because we showed **Independent Set**  $\leq_P$  **Clique**. If **Clique** had an efficient algorithm, so would **Independent Set**!

If  $X \leq_P Y$  and  $X$  does not have an efficient algorithm,  $Y$  cannot have an efficient algorithm!

# Polynomial-time reductions and hardness

For decision problems  $X$  and  $Y$ , if  $X \leq_P Y$ , and  $Y$  has an efficient algorithm,  $X$  has an efficient algorithm.

If you believe that **Independent Set** does not have an efficient algorithm, why should you believe the same of **Clique**?

Because we showed **Independent Set**  $\leq_P$  **Clique**. If **Clique** had an efficient algorithm, so would **Independent Set**!

If  $X \leq_P Y$  and  $X$  does not have an efficient algorithm,  $Y$  cannot have an efficient algorithm!

# Polynomial-time reductions and hardness

If you believe that **Independent Set** does not have an efficient algorithm, why should you believe the same of **Clique**?

Because we showed **Independent Set**  $\leq_P$  **Clique**. If **Clique** had an efficient algorithm, so would **Independent Set**!

If  $X \leq_P Y$  and  $X$  does not have an efficient algorithm,  $Y$  cannot have an efficient algorithm!

# Polynomial-time reductions and instance sizes

## Proposition

Let  $\mathcal{R}$  be a polynomial-time reduction from  $X$  to  $Y$ . Then for any instance  $I_X$  of  $X$ , the size of the instance  $I_Y$  of  $Y$  produced from  $I_X$  by  $\mathcal{R}$  is polynomial in the size of  $I_X$ .

## Proof.

$\mathcal{R}$  is a polynomial-time algorithm and hence on input  $I_X$  of size  $|I_X|$  it runs in time  $p(|I_X|)$  for some polynomial  $p()$ .

$I_Y$  is the output of  $\mathcal{R}$  on input  $I_X$ .

$\mathcal{R}$  can write at most  $p(|I_X|)$  bits and hence  $|I_Y| \leq p(|I_X|)$ . □

**Note:** Converse is not true. A reduction need not be polynomial-time even if output of reduction is of size polynomial in its input.

# Polynomial-time reductions and instance sizes

## Proposition

Let  $\mathcal{R}$  be a polynomial-time reduction from  $X$  to  $Y$ . Then for any instance  $I_X$  of  $X$ , the size of the instance  $I_Y$  of  $Y$  produced from  $I_X$  by  $\mathcal{R}$  is polynomial in the size of  $I_X$ .

## Proof.

$\mathcal{R}$  is a polynomial-time algorithm and hence on input  $I_X$  of size  $|I_X|$  it runs in time  $p(|I_X|)$  for some polynomial  $p()$ .

$I_Y$  is the output of  $\mathcal{R}$  on input  $I_X$ .

$\mathcal{R}$  can write at most  $p(|I_X|)$  bits and hence  $|I_Y| \leq p(|I_X|)$ . □

**Note:** Converse is not true. A reduction need not be polynomial-time even if output of reduction is of size polynomial in its input.

# Polynomial-time reductions and instance sizes

## Proposition

Let  $\mathcal{R}$  be a polynomial-time reduction from  $X$  to  $Y$ . Then for any instance  $I_X$  of  $X$ , the size of the instance  $I_Y$  of  $Y$  produced from  $I_X$  by  $\mathcal{R}$  is polynomial in the size of  $I_X$ .

## Proof.

$\mathcal{R}$  is a polynomial-time algorithm and hence on input  $I_X$  of size  $|I_X|$  it runs in time  $p(|I_X|)$  for some polynomial  $p()$ .

$I_Y$  is the output of  $\mathcal{R}$  on input  $I_X$ .

$\mathcal{R}$  can write at most  $p(|I_X|)$  bits and hence  $|I_Y| \leq p(|I_X|)$ . □

**Note:** Converse is not true. A reduction need not be polynomial-time even if output of reduction is of size polynomial in its input.

# Polynomial-time Reduction

A polynomial time reduction from a *decision* problem  $X$  to a *decision* problem  $Y$  is an *algorithm*  $\mathcal{A}$  that has the following properties:

- 1 Given an instance  $I_X$  of  $X$ ,  $\mathcal{A}$  produces an instance  $I_Y$  of  $Y$ .
- 2  $\mathcal{A}$  runs in time polynomial in  $|I_X|$ . This implies that  $|I_Y|$  (size of  $I_Y$ ) is polynomial in  $|I_X|$ .
- 3 Answer to  $I_X$  YES *iff* answer to  $I_Y$  is YES.

## Proposition

If  $X \leq_P Y$  then a polynomial time algorithm for  $Y$  implies a polynomial time algorithm for  $X$ .

# Transitivity of Reductions

## Proposition

$X \leq_P Y$  and  $Y \leq_P Z$  implies that  $X \leq_P Z$ .

**Note:**  $X \leq_P Y$  does not imply that  $Y \leq_P X$  and hence it is very important to know the FROM and TO in a reduction.

To prove  $X \leq_P Y$  you need to show a reduction FROM  $X$  TO  $Y$ .  
That is, show that an algorithm for  $Y$  implies an algorithm for  $X$ .
