Due Tuesday, November 30, 2021 at 8pm

- 1. (a) A **quasi-satisfying assignment** for a 3CNF boolean formula  $\Phi$  is an assignment of truth values to the variables such that at most one clause in  $\Phi$  does not contain a true literal.
  - Prove that it is NP-hard to determine whether a given 3CNF boolean formula has a quasi-satisfying assignment.
  - (b) A **near-clique** in a graph G = (V, E) is a subset of vertices  $S \subseteq V$  where adding a single edge between two vertices in S results in the set S becoming a clique. Prove that it is NP-hard to find the size of the largest near-clique in a graph G = (V, E).
- 2. A *wye* is an undirected graph that looks like the capital letter Y. More formally, a wye consists of three paths of equal length with one common endpoint, called the *hub*.

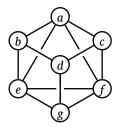

This grid graph contains a wye whose paths have length 4.

Prove that the following problem is NP-hard: Given an undirected graph G, what is the largest wye that is a subgraph of G? The three paths of the wye must not share any vertices except the hub, and they must have exactly the same length.

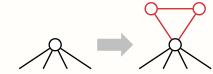

## **Solved Problem**

3. A *double-Hamiltonian tour* in an undirected graph *G* is a closed walk that visits every vertex in *G* exactly twice. Prove that it is NP-hard to decide whether a given graph *G* has a double-Hamiltonian tour.

This graph contains the double-Hamiltonian tour  $a \rightarrow b \rightarrow d \rightarrow g \rightarrow e \rightarrow b \rightarrow d \rightarrow c \rightarrow f \rightarrow a \rightarrow c \rightarrow f \rightarrow g \rightarrow e \rightarrow a$ .

**Solution:** We prove the problem is NP-hard with a reduction from the standard Hamiltonian cycle problem. Let G be an arbitrary undirected graph. We construct a new graph H by attaching a small gadget to every vertex of G. Specifically, for each vertex v, we add two vertices  $v^{\sharp}$  and  $v^{\flat}$ , along with three edges  $vv^{\flat}$ ,  $vv^{\sharp}$ , and  $v^{\flat}v^{\sharp}$ .

A vertex in G, and the corresponding vertex gadget in H.

I claim that *G* has a Hamiltonian cycle if and only if *H* has a double-Hamiltonian tour.

 $\Longrightarrow$  Suppose G has a Hamiltonian cycle  $\nu_1 \rightarrow \nu_2 \rightarrow \cdots \rightarrow \nu_n \rightarrow \nu_1$ . We can construct a double-Hamiltonian tour of H by replacing each vertex  $\nu_i$  with the following walk:

$$\cdots \rightarrow \nu_i \rightarrow \nu_i^{\flat} \rightarrow \nu_i^{\sharp} \rightarrow \nu_i^{\flat} \rightarrow \nu_i^{\sharp} \rightarrow \nu_i \rightarrow \cdots$$

Conversely, suppose H has a double-Hamiltonian tour D. Consider any vertex v in the original graph G; the tour D must visit v exactly twice. Those two visits split D into two closed walks, each of which visits v exactly once. Any walk from  $v^{\flat}$  or  $v^{\sharp}$  to any other vertex in H must pass through v. Thus, one of the two closed walks visits only the vertices v,  $v^{\flat}$ , and  $v^{\sharp}$ . Thus, if we simply remove the vertices in  $H \setminus G$  from D, we obtain a closed walk in G that visits every vertex in G once.

Given any graph G, we can clearly construct the corresponding graph H in polynomial time.

With more effort, we can construct a graph H that contains a double-Hamiltonian tour *that traverses each edge of* H *at most once* if and only if G contains a Hamiltonian cycle. For each vertex v in G we attach a more complex gadget containing five vertices and eleven edges, as shown on the next page.

A vertex in G, and the corresponding modified vertex gadget in H.

**Rubric:** 10 points, standard polynomial-time reduction rubric. This is not the only correct solution.

**Non-solution (self-loops):** We attempt to prove the problem is NP-hard with a reduction from the Hamiltonian cycle problem. Let G be an arbitrary undirected graph. We construct a new graph H by attaching a self-loop every vertex of G. Given any graph G, we can clearly construct the corresponding graph H in polynomial time.

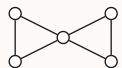

An incorrect vertex gadget.

Suppose *G* has a Hamiltonian cycle  $\nu_1 \rightarrow \nu_2 \rightarrow \cdots \rightarrow \nu_n \rightarrow \nu_1$ . We can construct a double-Hamiltonian tour of *H* by alternating between edges of the Hamiltonian cycle and self-loops:

$$v_1 \rightarrow v_1 \rightarrow v_2 \rightarrow v_2 \rightarrow v_3 \rightarrow \cdots \rightarrow v_n \rightarrow v_n \rightarrow v_1$$
.

Unfortunately, if H has a double-Hamiltonian tour, we *cannot* conclude that G has a Hamiltonian cycle, because we cannot guarantee that a double-Hamiltonian tour in H uses *any* self-loops. The graph G shown below is a counterexample; it has a double-Hamiltonian tour (even before adding self-loops!) but no Hamiltonian cycle.

This graph has a double-Hamiltonian tour.

**Some useful NP-hard problems.** You are welcome to use any of these in your own NP-hardness proofs, except of course for the specific problem you are trying to prove NP-hard.

CIRCUITSAT: Given a boolean circuit, are there any input values that make the circuit output TRUE?

**3SAT:** Given a boolean formula in conjunctive normal form, with exactly three distinct literals per clause, does the formula have a satisfying assignment?

**MAXINDEPENDENTSET:** Given an undirected graph *G*, what is the size of the largest subset of vertices in *G* that have no edges among them?

MAXCLIQUE: Given an undirected graph G, what is the size of the largest complete subgraph of G?

**MINVERTEXCOVER:** Given an undirected graph *G*, what is the size of the smallest subset of vertices that touch every edge in *G*?

**MINSETCOVER:** Given a collection of subsets  $S_1, S_2, ..., S_m$  of a set S, what is the size of the smallest subcollection whose union is S?

**MINHITTINGSET:** Given a collection of subsets  $S_1, S_2, ..., S_m$  of a set S, what is the size of the smallest subset of S that intersects every subset  $S_i$ ?

**3Color:** Given an undirected graph G, can its vertices be colored with three colors, so that every edge touches vertices with two different colors?

**Hamiltonian Path:** Given graph *G* (either directed or undirected), is there a path in *G* that visits every vertex exactly once?

**HamiltonianCycle:** Given a graph *G* (either directed or undirected), is there a cycle in *G* that visits every vertex exactly once?

**TRAVELINGSALESMAN:** Given a graph *G* (either directed or undirected) with weighted edges, what is the minimum total weight of any Hamiltonian path/cycle in *G*?

**LongestPath:** Given a graph *G* (either directed or undirected, possibly with weighted edges), what is the length of the longest simple path in *G*?

**STEINERTREE:** Given an undirected graph *G* with some of the vertices marked, what is the minimum number of edges in a subtree of *G* that contains every marked vertex?

**SubsetSum:** Given a set *X* of positive integers and an integer *k*, does *X* have a subset whose elements sum to *k*?

**PARTITION:** Given a set *X* of positive integers, can *X* be partitioned into two subsets with the same sum?

**3Partition:** Given a set X of 3n positive integers, can X be partitioned into n three-element subsets, all with the same sum?

**IntegerLinearProgramming:** Given a matrix  $A \in \mathbb{Z}^{n \times d}$  and two vectors  $b \in \mathbb{Z}^n$  and  $c \in \mathbb{Z}^d$ , compute  $\max\{c \cdot x \mid Ax \leq b, x \geq 0, x \in \mathbb{Z}^d\}$ .

**FEASIBLEILP:** Given a matrix  $A \in \mathbb{Z}^{n \times d}$  and a vector  $b \in \mathbb{Z}^n$ , determine whether the set of feasible integer points  $\max\{x \in \mathbb{Z}^d \mid Ax \leq b, x \geq 0\}$  is empty.

**Draughts:** Given an  $n \times n$  international draughts configuration, what is the largest number of pieces that can (and therefore must) be captured in a single move?

**SUPERMARIOBROTHERS:** Given an  $n \times n$  Super Mario Brothers level, can Mario reach the castle?
