### 17.3.5

The basic algorithm: Find the $i$ th closest vertex

## A Basic Strategy

Explore vertices in increasing order of distance from $\boldsymbol{s}$ :
(For simplicity assume that nodes are at different distances from $\boldsymbol{s}$ and that no edge has zero length)

```
Initialize for each node \(v, \operatorname{dist}(s, v)=\infty\)
Initialize \(X=\{s\}\),
for \(\boldsymbol{i}=\mathbf{2}\) to \(|\boldsymbol{V}|\) do
    (* Invariant: \(\boldsymbol{X}\) contains the \(\boldsymbol{i} \mathbf{- 1}\) closest nodes to \(\boldsymbol{s}\) *)
    Among nodes in \(\boldsymbol{V}-\boldsymbol{X}\), find the node \(\boldsymbol{v}\) that is the
        \(i\) th closest to \(s\)
    Update \(\operatorname{dist}(\boldsymbol{s}, \boldsymbol{v})\)
    \(X=X \cup\{v\}\)
```

How can we implement the step in the for loop?

## A Basic Strategy

Explore vertices in increasing order of distance from $\boldsymbol{s}$ :
(For simplicity assume that nodes are at different distances from $\boldsymbol{s}$ and that no edge has zero length)

```
Initialize for each node \(v, \operatorname{dist}(s, v)=\infty\)
Initialize \(\boldsymbol{X}=\{\boldsymbol{s}\}\),
for \(\boldsymbol{i}=\mathbf{2}\) to \(|\boldsymbol{V}|\) do
    (* Invariant: \(\boldsymbol{X}\) contains the \(\boldsymbol{i} \mathbf{- 1}\) closest nodes to \(\boldsymbol{s}\) *)
    Among nodes in \(\boldsymbol{V}-\boldsymbol{X}\), find the node \(\boldsymbol{v}\) that is the
        \(i\) th closest to \(s\)
    Update \(\operatorname{dist}(\boldsymbol{s}, \boldsymbol{v})\)
    \(X=X \cup\{v\}\)
```

How can we implement the step in the for loop?

## Finding the ith closest node

(1) $\boldsymbol{X}$ contains the $\boldsymbol{i}-\mathbf{1}$ closest nodes to $\boldsymbol{s}$
(2) Want to find the $\boldsymbol{i t h}$ closest node from $\boldsymbol{V}-\boldsymbol{X}$.

What do we know about the $i$ th closest node?

Let $\boldsymbol{P}$ be a shortest path from $\boldsymbol{s}$ to $\boldsymbol{v}$ where $\boldsymbol{v}$ is the $\boldsymbol{i}$ th closest node. Then, all intermediate nodes in $\boldsymbol{P}$ belong to $\boldsymbol{X}$.

## Finding the ith closest node

(1) $\boldsymbol{X}$ contains the $\boldsymbol{i}-\mathbf{1}$ closest nodes to $\boldsymbol{s}$
(2) Want to find the $\boldsymbol{i t h}$ closest node from $\boldsymbol{V}-\boldsymbol{X}$.

What do we know about the $i$ th closest node?

## Claim

Let $\boldsymbol{P}$ be a shortest path from $\boldsymbol{s}$ to $\boldsymbol{v}$ where $\boldsymbol{v}$ is the $\boldsymbol{i}$ th closest node. Then, all intermediate nodes in $\boldsymbol{P}$ belong to $\boldsymbol{X}$.

## Finding the ith closest node

(1) $\boldsymbol{X}$ contains the $\boldsymbol{i}-\mathbf{1}$ closest nodes to $\boldsymbol{s}$
(2) Want to find the $\boldsymbol{i t h}$ closest node from $\boldsymbol{V}-\boldsymbol{X}$.

What do we know about the ith closest node?

## Claim

Let $\boldsymbol{P}$ be a shortest path from $\boldsymbol{s}$ to $\boldsymbol{v}$ where $\boldsymbol{v}$ is the $\boldsymbol{i}$ th closest node. Then, all intermediate nodes in $\boldsymbol{P}$ belong to $\boldsymbol{X}$.

## Proof.

If $\boldsymbol{P}$ had an intermediate node $\boldsymbol{u}$ not in $\boldsymbol{X}$ then $\boldsymbol{u}$ will be closer to $\boldsymbol{s}$ than $\boldsymbol{v}$. Implies $\boldsymbol{v}$ is not the $\boldsymbol{i}$ th closest node to $\boldsymbol{s}$ - recall that $\boldsymbol{X}$ already has the $\boldsymbol{i} \mathbf{- \mathbf { 1 }}$ closest nodes.

## Finding the ith closest node

## Corollary

The ith closest node is adjacent to $\boldsymbol{X}$.

## Summary

Proved that the basic algorithm is (intuitively) correct...
...but is missing details
...and how to implement efficiently?

## THE END

(for now)
