Restating problem of Shortest path with negative edges

## Alternatively: Finding Shortest Walks

Given a graph $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{E})$ :
(1) A path is a sequence of distinct vertices $\boldsymbol{v}_{\mathbf{1}}, \boldsymbol{v}_{\mathbf{2}}, \ldots, \boldsymbol{v}_{k}$ such that $\left(\boldsymbol{v}_{\boldsymbol{i}}, \boldsymbol{v}_{\boldsymbol{i}+\boldsymbol{1}}\right) \in \boldsymbol{E}$ for $\mathbf{1} \leq i \leq k-1$.
(2) A walk is a sequence of vertices $\boldsymbol{v}_{\mathbf{1}}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{k}$ such that $\left(\boldsymbol{v}_{\boldsymbol{i}}, \boldsymbol{v}_{\boldsymbol{i}+\boldsymbol{1}}\right) \in \boldsymbol{E}$ for $\mathbf{1} \leq \boldsymbol{i} \leq \boldsymbol{k}-\mathbf{1}$. Vertices are allowed to repeat.

Define $\boldsymbol{\operatorname { d i s t }}(\boldsymbol{u}, \boldsymbol{v})$ to be the length of a shortest walk from $\boldsymbol{u}$ to $\boldsymbol{v}$.
(1) If there is a walk from $\boldsymbol{u}$ to $\boldsymbol{v}$ that contains negative length cycle then $\operatorname{dist}(u, v)=-\infty$
(2) Else there is a path with at most $\boldsymbol{n}-\mathbf{1}$ edges whose length is equal to the length of a shortest walk and $\operatorname{dist}(\boldsymbol{u}, \boldsymbol{v})$ is finite
Helpful to think about walks

## Shortest Paths with Negative Edge Lengths

## Problems

## Algorithmic Problems

Input: A directed graph $\boldsymbol{G}=(\boldsymbol{V}, \boldsymbol{E})$ with edge lengths (could be negative). For edge $\boldsymbol{e}=(\boldsymbol{u}, \boldsymbol{v}), \ell(\boldsymbol{e})=\ell(\boldsymbol{u}, \boldsymbol{v})$ is its length.

## Questions:

(1) Given nodes $\boldsymbol{s}, \boldsymbol{t}$, either find a negative length cycle $\boldsymbol{C}$ that $\boldsymbol{s}$ can reach or find a shortest path from $\boldsymbol{s}$ to $\boldsymbol{t}$.
(2) Given node $\boldsymbol{s}$, either find a negative length cycle $\boldsymbol{C}$ that $\boldsymbol{s}$ can reach or find shortest path distances from $\boldsymbol{s}$ to all reachable nodes.
(3) Check if $\boldsymbol{G}$ has a negative length cycle or not.

## Shortest Paths with Negative Edge Lengths

## In Undirected Graphs

Note: With negative lengths, shortest path problems and negative cycle detection in undirected graphs cannot be reduced to directed graphs by bi-directing each undirected edge. Why?

Problem can be solved efficiently in undirected graphs but algorithms are different and significantly more involved than those for directed graphs. One need to compute $\boldsymbol{T}$-joins in the relevant graph. Pretty painful stuff.

## THE END

(for now)
