## Algorithms \& Models of Computation CS/ECE 374, Fall 2020 <br> 5.1 <br> Equivalence of NFAs and DFAs

## Regular Languages, DFAs, NFAs

Theorem
Languages accepted by DFAs, NFAs, and regular expressions are the same.

- DFAs are special cases of NFAs (easy)
- NFAs accept regular expressions (seen)
- DFAs accept languages accepted by NFAs (shortly)
- Regular expressions for languages accepted by DFAs (later in the course)

## Regular Languages, DFAs, NFAs

## Theorem

Languages accepted by DFAs, NFAs, and regular expressions are the same.

- DFAs are special cases of NFAs (easy)
- NFAs accept regular expressions (seen)
- DFAs accept languages accepted by NFAs (shortly)
- Regular expressions for languages accepted by DFAs (later in the course)

## Equivalence of NFAs and DFAs

## Theorem

For every NFA $N$ there is a DFA $M$ such that $L(M)=L(N)$.

## Algorithms \& Models of Computation CS/ECE 374, Fall 2020 <br> 5.1.1 <br> The idea of the conversion of NFA to DFA

## DFAs are memoryless...

(1) DFA knows only its current state.
(2) The state is the memory.
(3) To design a DFA, answer the question: What minimal info needed to solve problem.

## Simulating NFA

## Example the first revisited

Previous lecture.. Ran NFA
 on input ababa.

## The state of the NFA

It is easy to state that the state of the automata is the states that it might be situated at.
(N1)

configuration: A set of states the automata might be in.
Possible configurations: $\emptyset,\{A\},\{A, B\}$
Big idea: Build a DFA on the configurations.

## The state of the NFA

It is easy to state that the state of the automata is the states that it might be situated at.
(N1)

configuration: $A$ set of states the automata might be in.

## The state of the NFA

It is easy to state that the state of the automata is the states that it might be situated at.
(N1)

Possible configurations: $\emptyset,\{A\},\{A, B\} \ldots$
Big idea: Build a DFA on the configurations.

## The state of the NFA

It is easy to state that the state of the automata is the states that it might be situated at.

configuration: $A$ set of states the automata might be in.
Possible configurations: $\emptyset,\{A\},\{A, B\} \ldots$
Big idea: Build a DFA on the configurations.

## Example

## Simulating an NFA by a DFA

- Think of a program with fixed memory that needs to simulate NFA $N$ on input $w$.
- What does it need to store after seeing a prefix $x$ of $\boldsymbol{w}$ ?
- It needs to know at least $\delta^{*}(s, x)$, the set of states that $N$ could be in after reading $x$
- Is it sufficient? Yes, if it can compute $\delta^{*}(s, x a)$ after seeing another symbol a in the input.
- When should the program accept a string w? If $\delta^{*}(s, w) \cap A \neq \emptyset$ Key Observation: DFA $M$ simulating $N$ should know current configuration of $N$. State space of the DFA is $\mathcal{P}(Q)$

## Simulating an NFA by a DFA

Key Observation: DFA $M$ simulating $N$ should know current configuration of $N$.

State space of the DFA is $\mathcal{P}(Q)$.

## Example: DFA from NFA

DFA:

## Formal Tuple Notation for NFA

## Definition

A non-deterministic finite automata (NFA) $N=(Q, \Sigma, \delta, s, A)$ is a five tuple where

- $Q$ is a finite set whose elements are called states,
- $\Sigma$ is a finite set called the input alphabet,
- $\delta: Q \times \Sigma \cup\{\epsilon\} \rightarrow \mathcal{P}(Q)$ is the transition function (here $\mathcal{P}(Q)$ is the power set of $Q$ ),
- $s \in Q$ is the start state,
- $\boldsymbol{A} \subseteq Q$ is the set of accepting/final states.
$\delta(q, a)$ for $a \in \Sigma \cup\{\epsilon\}$ is a subset of $Q$ - a set of states.

## THE END

(for now)

## Algorithms \& Models of Computation <br> CS/ECE 374, Fall 2020 <br> 5.1.2 <br> Algorithm for converting NFA to DFA

## Recall I

## Extending the transition function to strings

## Definition

For NFA $\boldsymbol{N}=(\boldsymbol{Q}, \Sigma, \boldsymbol{\delta}, \boldsymbol{s}, \boldsymbol{A})$ and $\boldsymbol{q} \in \boldsymbol{Q}$ the $\boldsymbol{\epsilon r e a c h}(\boldsymbol{q})$ is the set of all states that $\boldsymbol{q}$ can reach using only $\epsilon$-transitions.

## Definition

Inductive definition of $\delta^{*}: Q \times \Sigma^{*} \rightarrow \mathcal{P}(Q)$ :

- if $w=\varepsilon, \delta^{*}(\boldsymbol{q}, \boldsymbol{w})=\boldsymbol{\epsilon r e a c h}(\boldsymbol{q})$
- if $w=a$ where $a \in \Sigma: \quad \delta^{*}(q, a)=\operatorname{creach}\left(\bigcup_{p \in \operatorname{\epsilon reach}(q)} \delta(p, a)\right)$
- if $w=a x$ :

$$
\delta^{*}(q, w)=\operatorname{\epsilon reach}\left(\bigcup_{p \in \operatorname{ereach}(q)} \bigcup_{r \in \delta^{*}(p, a)} \delta^{*}(r, x)\right)
$$

## Recall II

Formal definition of language accepted by N

## Definition

A string $w$ is accepted by NFA $N$ if $\delta_{N}^{*}(s, w) \cap A \neq \emptyset$.

## Definition

The language $L(N)$ accepted by a NFA $N=(Q, \Sigma, \delta, s, A)$ is

$$
\left\{w \in \Sigma^{*} \mid \delta^{*}(s, w) \cap A \neq \emptyset\right\}
$$

## Subset Construction

NFA $\boldsymbol{N}=(\boldsymbol{Q}, \Sigma, s, \boldsymbol{\delta}, \boldsymbol{A})$. We create a DFA $\boldsymbol{D}=\left(\boldsymbol{Q}^{\prime}, \Sigma, \boldsymbol{\delta}^{\prime}, s^{\prime}, \boldsymbol{A}^{\prime}\right)$ as follows:

- $Q^{\prime}=\mathcal{P}(Q)$
- $s^{\prime}=\operatorname{\epsilon reach}(s)=\delta^{*}(s, \epsilon)$
- $A^{\prime}=\{X \subseteq Q \mid X \cap A \neq \emptyset\}$
- $\delta^{\prime}(X, a)=\cup_{q \in X} \delta^{*}(q, a)$ for each $X \subseteq Q, a \in \Sigma$.

## Subset Construction

NFA $\boldsymbol{N}=(\boldsymbol{Q}, \Sigma, \boldsymbol{s}, \boldsymbol{\delta}, \boldsymbol{A})$. We create a DFA $\boldsymbol{D}=\left(Q^{\prime}, \Sigma, \boldsymbol{\delta}^{\prime}, s^{\prime}, A^{\prime}\right)$ as follows:

- $Q^{\prime}=\mathcal{P}(Q)$
- $s^{\prime}=\epsilon \operatorname{reach}(s)=\delta^{*}(s, \epsilon)$
- $A^{\prime}=\{X \subseteq Q \mid X \cap A \neq \emptyset\}$
- $\delta^{\prime}(X, a)=\cup_{q \in X} \delta^{*}(q, a)$ for each $X \subseteq Q$, $a \in \Sigma$.

## Subset Construction

NFA $N=(Q, \Sigma, s, \boldsymbol{\delta}, \boldsymbol{A})$. We create a DFA $\boldsymbol{D}=\left(\boldsymbol{Q}^{\prime}, \Sigma, \boldsymbol{\delta}^{\prime}, \boldsymbol{s}^{\prime}, \boldsymbol{A}^{\prime}\right)$ as follows:

- $Q^{\prime}=\mathcal{P}(Q)$
- $s^{\prime}=\epsilon \operatorname{reach}(s)=\delta^{*}(s, \epsilon)$
- $A^{\prime}=\{X \subseteq Q \mid X \cap A \neq \emptyset\}$
- $\delta^{\prime}(X, a)=\cup_{q \in X} \delta^{*}(q, a)$ for each $X \subseteq Q$, $a \in \Sigma$.

## Subset Construction

NFA $\boldsymbol{N}=(\boldsymbol{Q}, \Sigma, s, \boldsymbol{\delta}, \boldsymbol{A})$. We create a DFA $\boldsymbol{D}=\left(\boldsymbol{Q}^{\prime}, \Sigma, \boldsymbol{\delta}^{\prime}, s^{\prime}, \boldsymbol{A}^{\prime}\right)$ as follows:

- $Q^{\prime}=\mathcal{P}(Q)$
- $s^{\prime}=\epsilon \operatorname{reach}(s)=\delta^{*}(s, \epsilon)$
- $A^{\prime}=\{X \subseteq Q \mid X \cap A \neq \emptyset\}$
- $\delta^{\prime}(X, a)=\cup_{q \in X} \delta^{*}(q, a)$ for each $X \subseteq Q, a \in \Sigma$.

## Incremental construction

Only build states reachable from $s^{\prime}=\boldsymbol{\epsilon r e a c h}(s)$ the start state of $D$

$$
\delta^{\prime}(X, a)=\cup_{q \in X} \delta^{*}(q, a)
$$

## An optimization: Incremental algorithm

- Build $D$ beginning with start state $s^{\prime}==\epsilon \operatorname{reach}(s)$
- For each existing state $\boldsymbol{X} \subseteq Q$ consider each $\boldsymbol{a} \in \Sigma$ and calculate the state $U=\boldsymbol{\delta}^{\prime}(X, a)=\cup_{q \in X} \boldsymbol{\delta}^{*}(q, a)$ and add a transition.

To compute $Z_{q, a}=\delta^{*}(q, a)$ - set of all states reached from $q$ on character a

- Compute $\boldsymbol{X}_{1}=\boldsymbol{\epsilon r e a c h}(\boldsymbol{q})$
- Compute $\boldsymbol{Y}_{1}=\cup_{\boldsymbol{p} \in \boldsymbol{X}_{1}} \delta(\boldsymbol{p}, \boldsymbol{a})$
- Compute $Z_{q, a}=\operatorname{\epsilon reach}(\boldsymbol{Y})=\cup_{r \in Y_{1}}$ ereach $(r)$
- If $\boldsymbol{U}$ is a new state add it to reachable states that need to be explored

## An optimization: Incremental algorithm

- Build $D$ beginning with start state $s^{\prime}==\epsilon \operatorname{reach}(s)$
- For each existing state $\boldsymbol{X} \subseteq Q$ consider each $a \in \Sigma$ and calculate the state $U=\boldsymbol{\delta}^{\prime}(X, a)=\cup_{q \in X} \boldsymbol{\delta}^{*}(\boldsymbol{q}, a)$ and add a transition.
To compute $\boldsymbol{Z}_{\boldsymbol{q}, \mathrm{a}}=\boldsymbol{\delta}^{*}(\boldsymbol{q}, \boldsymbol{a})$ - set of all states reached from $\boldsymbol{q}$ on character $\boldsymbol{a}$
- Compute $\boldsymbol{X}_{1}=\boldsymbol{\operatorname { r r e a c h }}(\boldsymbol{q})$
- Compute $\boldsymbol{Y}_{1}=\cup_{p \in X_{1}} \boldsymbol{\delta}(\boldsymbol{p}, \boldsymbol{a})$
- Compute $\boldsymbol{Z}_{\boldsymbol{q}, \boldsymbol{a}}=\boldsymbol{\epsilon r e a c h}(\boldsymbol{Y})=\cup_{\boldsymbol{r} \in \boldsymbol{Y}_{1}} \boldsymbol{\epsilon r e a c h}(\boldsymbol{r})$
- If $U$ is a new state add it to reachable states that need to be explored

## An optimization: Incremental algorithm

- Build $D$ beginning with start state $s^{\prime}==\epsilon \operatorname{reach}(s)$
- For each existing state $\boldsymbol{X} \subseteq Q$ consider each $a \in \Sigma$ and calculate the state $U=\boldsymbol{\delta}^{\prime}(X, a)=\cup_{q \in X} \boldsymbol{\delta}^{*}(\boldsymbol{q}, a)$ and add a transition.
To compute $\boldsymbol{Z}_{\boldsymbol{q}, \mathrm{a}}=\boldsymbol{\delta}^{*}(\boldsymbol{q}, \boldsymbol{a})$ - set of all states reached from $\boldsymbol{q}$ on character $\boldsymbol{a}$
- Compute $\boldsymbol{X}_{1}=\boldsymbol{\operatorname { r r e a c h }}(\boldsymbol{q})$
- Compute $\boldsymbol{Y}_{1}=\cup_{p \in X_{1}} \boldsymbol{\delta}(\boldsymbol{p}, \boldsymbol{a})$
- Compute $\boldsymbol{Z}_{\boldsymbol{q}, \boldsymbol{a}}=\boldsymbol{\epsilon r e a c h}(\boldsymbol{Y})=\cup_{\boldsymbol{r} \in \boldsymbol{Y}_{1}} \boldsymbol{\epsilon r e a c h}(\boldsymbol{r})$
- If $\boldsymbol{U}$ is a new state add it to reachable states that need to be explored.

## THE END

## Algorithms \& Models of Computation CS/ECE 374, Fall 2020 <br> 5.1.3 <br> Proof of correctness of conversion of NFA to DFA

## Proof of Correctness

Theorem<br>Let $\boldsymbol{N}=(\boldsymbol{Q}, \Sigma, s, \delta, \boldsymbol{A})$ be a NFA and let $\boldsymbol{D}=\left(Q^{\prime}, \Sigma, \delta^{\prime}, s^{\prime}, \boldsymbol{A}^{\prime}\right)$ be a DFA constructed from $N$ via the subset construction. Then $L(N)=L(D)$.

## Stronger claim

Lemma
For every string $w, \delta_{N}^{*}(s, w)=\delta_{D}^{*}\left(s^{\prime}, w\right)$
Proof by induction on $|w|$

## Proof of Correctness

# Theorem <br> Let $\boldsymbol{N}=(\boldsymbol{Q}, \Sigma, s, \delta, \boldsymbol{A})$ be a NFA and let $\boldsymbol{D}=\left(\boldsymbol{Q}^{\prime}, \Sigma, \boldsymbol{\delta}^{\prime}, s^{\prime}, \boldsymbol{A}^{\prime}\right)$ be a DFA constructed from $N$ via the subset construction. Then $L(N)=L(D)$. 

Stronger claim:
Lemma
For every string $w, \delta_{N}^{*}(s, w)=\delta_{D}^{*}\left(s^{\prime}, w\right)$.
Proof by induction on $|w|$

## Proof of Correctness

# Theorem <br> Let $\boldsymbol{N}=(\boldsymbol{Q}, \Sigma, s, \delta, \boldsymbol{A})$ be a NFA and let $\boldsymbol{D}=\left(\boldsymbol{Q}^{\prime}, \Sigma, \boldsymbol{\delta}^{\prime}, s^{\prime}, \boldsymbol{A}^{\prime}\right)$ be a DFA constructed from $N$ via the subset construction. Then $L(N)=L(D)$. 

Stronger claim:
Lemma
For every string $w, \delta_{N}^{*}(s, w)=\delta_{D}^{*}\left(s^{\prime}, w\right)$.
Proof by induction on $|w|$.

## Proof continued I

## Lemma

For every string $w, \delta_{N}^{*}(s, w)=\delta_{D}^{*}\left(s^{\prime}, w\right)$.

## Proof:

Base case: $w=\boldsymbol{\epsilon}$.
$\delta_{N}^{*}(s, \epsilon)=\epsilon \operatorname{reach}(s)$.
$\delta_{D}^{*}\left(s^{\prime}, \epsilon\right)=s^{\prime}=\epsilon \operatorname{reach}(s)$ by definition of $s^{\prime}$.

## Proof continued II

## Lemma

For every string $w, \delta_{N}^{*}(s, w)=\delta_{D}^{*}\left(s^{\prime}, w\right)$.
Inductive step: $w=x a \quad$ (Note: suffix definition of strings)
$\delta_{N}^{*}(s, x a)=\cup_{p \in \delta_{N}^{*}(s, x)} \delta_{N}^{*}(p, a)$ by inductive definition of $\delta_{N}^{*}$
$\delta_{D}^{*}\left(S^{\prime}, x a\right)=\delta_{D}\left(\delta_{D}^{*}(s, x), a\right)$ by inductive definition of $\delta_{D}^{*}$
By inductive hypothesis: $Y=\delta_{N}^{*}(s, x)=\delta_{D}^{*}(s, x)$
Thus $\delta_{N}^{*}(s, x a)=\cup_{p \in Y} \delta_{N}^{*}(p, a)=\delta_{D}(Y, a)$ by definition of $\delta_{D}$.
Therefore,
$\delta_{N}^{*}(s, x a)=\delta_{D}(Y, a)=\delta_{D}\left(\delta_{D}^{*}(s, x), a\right)=\delta_{M}^{*}\left(s^{\prime}, x a\right)$. which is what we need

## Proof continued II

## Lemma

For every string $w, \delta_{N}^{*}(s, w)=\delta_{D}^{*}\left(s^{\prime}, w\right)$.
Inductive step: $w=x a \quad$ (Note: suffix definition of strings)
$\delta_{N}^{*}(s, x a)=\cup_{p \in \delta_{N}^{*}(s, x)} \delta_{N}^{*}(p, a)$ by inductive definition of $\delta_{N}^{*}$
$\delta_{D}^{*}\left(s^{\prime}, x a\right)=\delta_{D}\left(\delta_{D}^{*}(s, x), a\right)$ by inductive definition of $\delta_{D}^{*}$

Therefore,
$\delta_{N}^{*}(\boldsymbol{s}, \boldsymbol{x a})=\delta_{D}(Y, a)=\delta_{D}\left(\delta_{D}^{*}(s, x), a\right)=\delta_{M}^{*}\left(s^{\prime}, x a\right)$. which is what we need

## Proof continued II

## Lemma

For every string $w, \delta_{N}^{*}(s, w)=\delta_{D}^{*}\left(s^{\prime}, w\right)$.
Inductive step: $w=x a \quad$ (Note: suffix definition of strings)
$\delta_{N}^{*}(s, x a)=\cup_{p \in \delta_{N}^{*}(s, x)} \delta_{N}^{*}(p, a)$ by inductive definition of $\delta_{N}^{*}$
$\delta_{D}^{*}\left(s^{\prime}, x a\right)=\delta_{D}\left(\delta_{D}^{*}(s, x), a\right)$ by inductive definition of $\delta_{D}^{*}$
By inductive hypothesis: $Y=\delta_{N}^{*}(s, x)=\delta_{D}^{*}(s, x)$
Thus $\delta_{N}^{*}(s, x a)=\cup_{p \in Y} \delta_{N}^{*}(p, a)=\delta_{D}(Y, a)$ by definition of $\delta_{D}$.
Therefore,
$\delta_{N}^{*}(s, x a)=\delta_{D}(Y, a)=\delta_{D}\left(\delta_{D}^{*}(s, x), a\right)=\delta_{M}^{*}\left(s^{\prime}, x a\right)$. which is what we need

## Proof continued II
