## Algorithms \& Models of Computation

## CS/ECE 374, Fall 2020

14.1

Review of dynamic programming and some new problems

## What is the running time of the following?

Consider computing $f(x, y)$ by recursive function + memoization.

$$
\begin{array}{r}
f(x, y)=\sum_{i=1}^{x+y-1} x * f(x+y-i, i-1) \\
f(0, y)=y \quad f(x, 0)=x
\end{array}
$$

The resulting algorithm when computing $\boldsymbol{f}(\boldsymbol{n}, \boldsymbol{n})$ would take:
a $O(n)$
a $O(n \log n)$
a $O\left(n^{2}\right)$

- $O\left(n^{3}\right)$
a The function is ill defined - it can not be computed.

## Recipe for Dynamic Programming

(1) Develop a recursive backtracking style algorithm $\mathcal{A}$ for given problem.
(2) Identify structure of subproblems generated by $\mathcal{A}$ on an instance I of size $\boldsymbol{n}$
(1) Estimate number of different subproblems generated as a function of $\boldsymbol{n}$. Is it polynomial or exponential in $\boldsymbol{n}$ ?
(2) If the number of problems is "small" (polynomial) then they typically have some "clean" structure.
(3) Rewrite subproblems in a compact fashion.
(4) Rewrite recursive algorithm in terms of notation for subproblems.
(5) Convert to iterative algorithm by bottom up evaluation in an appropriate order.
(0) Optimize further with data structures and/or additional ideas.

## Algorithms \& Models of Computation

## CS/ECE 374, Fall 2020

14.1.1

Is in $L^{k}$ ?

## A variation

Input A string $w \in \Sigma^{*}$ and access to a language $L \subseteq \Sigma^{*}$ via function IsStringinL(string $x$ ) that decides whether $x$ is in $L$, and non-negative integer $k$
Goal Decide if $w \in L^{k}$ using IsStringinL(string $x$ ) as a black box sub-routine

## Example

Suppose $L$ is English and we have a procedure to check whether a string/word is in the English dictionary.

- Is the string "isthisanenglishsentence" in English ${ }^{5}$ ?
- Is the string "isthisanenglishsentence" in English ${ }^{4}$ ?
- Is "asinineat" in English ${ }^{2}$ ?
- Is "asinineat" in English ${ }^{4}$ ?
- Is "zibzzzad" in English ${ }^{1}$ ?

## Recursive Solution

## When is $w \in L^{k}$ ?

$k=0: w \in L^{k}$ iff $w=\epsilon$
$k=1: w \in L^{k}$ iff $w \in L$
$k>1: w \in L^{k}$ if $w=u v$ with $u \in L^{k-1}$ and $v \in L$
Assume $w$ is stored in array $A[1 . . n]$
IsStringinLk(A[1 $\ldots i], k)$ :
if $\boldsymbol{k}=0$ and $\boldsymbol{i}=0$ then return YES
if $\boldsymbol{k}=0$ then return NO $/ / i>0$
if $k=1$ then
return IsStringinL $(A[1 \ldots i])$
for $\ell=1 \ldots i-1$ do
if IsStringinLk $(\boldsymbol{A}[1 \ldots \ell], k-1)$ and IsStringinL $(A[\ell+1 \ldots i])$ then return YES
return NO

## Recursive Solution

When is $w \in L^{k}$ ?
$k=0: w \in L^{k}$ iff $w=\boldsymbol{\epsilon}$
$k=1: w \in L^{k}$ iff $w \in L$
$k>1: w \in L^{k}$ if $w=u v$ with $u \in L^{k-1}$ and $v \in L$
Assume $w$ is stored in array $A[1 . . n]$

```
IsStringinLk(A[1
    if }\boldsymbol{k}=0\mathrm{ and i=0 then return YES
    if k=0 then return NO // i>0
if k=1 then
    return IsStringinL(A[1 . . i])
for }\ell=1...i-1 d
    if IsStringinLk(A[1..\ell],k-1) and IsStringinL}(A[\ell+1\ldotsi]) the
        return YES
```

## Recursive Solution

When is $w \in L^{k}$ ?
$k=0: w \in L^{k}$ iff $w=\epsilon$
$k=1: w \in L^{k}$ iff $w \in L$
$k>1: w \in L^{k}$ if $w=u v$ with $u \in L^{k-1}$ and $v \in L$
Assume $\boldsymbol{w}$ is stored in array $\boldsymbol{A}[1 . . n]$
IsStringinLk $(\boldsymbol{A}[1 \ldots \boldsymbol{i}], \boldsymbol{k})$ :
if $\boldsymbol{k}=0$ and $\boldsymbol{i}=0$ then return YES
if $k=0$ then return NO $/ / i>0$
if $k=1$ then
return IsStringinL(A[1...i])
for $\ell=1 \ldots i-1$ do
if $\operatorname{IsStringinLk}(\boldsymbol{A}[1 \ldots \ell], \boldsymbol{k}-1)$ and $\operatorname{IsStringinL}(\boldsymbol{A}[\ell+1 \ldots \boldsymbol{i}])$ then return YES
return NO

## Analysis

```
IsStringinLk(A[1...i],k):
    if \boldsymbol{k}=0\mathrm{ and i=0 then return YES}
    if k}=0\mathrm{ then return NO // i>0
    if k}=1\mathrm{ then
        return IsStringinL(A[1_. i])
    for }\ell=1\ldots..i-1 d
        if IsStringinLk(A[1\ldots\ell],\boldsymbol{k}-1)\mathrm{ and IsStringinL}(\boldsymbol{A}[\ell+1\ldots\boldsymbol{I}])\mathrm{ then}
            return YES
    return NO
```

- How many distinct sub-problems are generated by IsStringinLk(A[1..n],k)?
- How much space? $O(n k)$
- Running time if we use memoization? $O\left(n^{2} k\right)$

## Analysis

```
IsStringinLk(A[1...i],k):
    if \boldsymbol{k}=0}0\mathrm{ and i=0 then return YES
    if }\boldsymbol{k}=0\mathrm{ then return NO // i>0
    if }\boldsymbol{k}=1\mathrm{ then
            return IsStringinL(A[1. . i])
    for }\ell=1\ldotsi-1 d
        if IsStringinLk(A[1\ldots\ell],\boldsymbol{k}-1) and IsStringinL}(\boldsymbol{A}[\ell+1\ldotsi])\mathrm{ then
            return YES
    return NO
```

- How many distinct sub-problems are generated by IsStringinLk(A[1..n],k)? $O(n k)$
- How much space? O(nk)
- Running time if we use memoization? $O\left(n^{2} k\right)$

## Analysis

```
IsStringinLk(A[1...i],k):
    if \boldsymbol{k}=0}0\mathrm{ and i=0 then return YES
    if }\boldsymbol{k}=0\mathrm{ then return NO // i>0
    if }\boldsymbol{k}=1\mathrm{ then
        return IsStringinL(A[1. . i])
    for }\ell=1\ldotsi-1 d
        if IsStringinLk(A[1\ldots\ell],\boldsymbol{k}-1) and IsStringinL}(\boldsymbol{A}[\ell+1\ldotsi])\mathrm{ then
            return YES
    return NO
```

- How many distinct sub-problems are generated by IsStringinLk(A[1..n],k)? $O(n k)$
- How much space? O(nk)
- Running time if we use memoization? $O\left(n^{2} k\right)$

## Analysis

```
IsStringinLk(A[1...i],k):
    if \boldsymbol{k}=0}0\mathrm{ and i=0 then return YES
    if }\boldsymbol{k}=0\mathrm{ then return NO // i>0
    if }\boldsymbol{k}=1\mathrm{ then
        return IsStringinL(A[1...i])
    for }\ell=1\ldots..i-1 d
        if IsStringinLk(A[1\ldots\ell],\boldsymbol{k}-1) and IsStringinL}(\boldsymbol{A}[\ell+1\ldotsi])\mathrm{ then
            return YES
    return NO
```

- How many distinct sub-problems are generated by IsStringinLk(A[1..n],k)? $O(n k)$
- How much space? $O(n k)$
- Running time if we use memoization? $O\left(n^{2} k\right)$

## Analysis

```
IsStringinLk(A[1...i],k):
    if }\boldsymbol{k}=0\mathrm{ and i=0 then return YES
    if }\boldsymbol{k}=0\mathrm{ then return NO // i>0
    if }\boldsymbol{k}=1\mathrm{ then
            return IsStringinL(A[1...i])
    for }\ell=1\ldotsi-1 d
        if IsStringinLk(A[1\ldots\ell],\boldsymbol{k}-1) and IsStringinL}(\boldsymbol{A}[\ell+1\ldotsi])\mathrm{ then
            return YES
    return NO
```

- How many distinct sub-problems are generated by IsStringinLk(A[1..n],k)? O(nk)
- How much space? $O(n k)$
- Running time if we use memoization?

## Analysis

```
IsStringinLk(A[1...i],k):
    if \boldsymbol{k}=0}0\mathrm{ and i=0 then return YES
    if }\boldsymbol{k}=0\mathrm{ then return NO // i>0
    if }\boldsymbol{k}=1\mathrm{ then
            return IsStringinL(A[1...i])
    for }\ell=1\ldotsi-1 d
        if IsStringinLk(A[1\ldots\ell],\boldsymbol{k}-1) and IsStringinL}(\boldsymbol{A}[\ell+1\ldotsi])\mathrm{ then
            return YES
    return NO
```

- How many distinct sub-problems are generated by IsStringinLk(A[1..n],k)? O(nk)
- How much space? $O(n k)$
- Running time if we use memoization? $O\left(n^{2} k\right)$

## Another variant

Question: What if we want to check if $w \in L^{i}$ for some $0 \leq i \leq k$ ? That is, is $w \in \cup_{i=0}^{k} L^{i}$ ?

## Exercise

## Definition

A string is a palindrome if $w=w^{R}$.
Examples: I, RACECAR, MALAYALAM, DOOFFOOD

Problem: Given a string $w$ find the longest subsequence of $w$ that is a palindrome.
Example
MAHDYNAMICPROGRAMZLETMESHOWYOUTHEM has
MHYMRORMYHM as a palindromic subsequence

## Exercise

## Definition <br> A string is a palindrome if $w=w^{R}$. <br> Examples: I, RACECAR, MALAYALAM, DOOFFOOD

Problem: Given a string $w$ find the longest subsequence of $w$ that is a palindrome.
Example
MAHDYNAMICPROGRAMZLETMESHOWYOUTHEM has MHYMRORMYHM as a palindromic subsequence

## Exercise

Assume $\boldsymbol{w}$ is stored in an array $\boldsymbol{A}[1 . . n]$
$\operatorname{LPS}(\boldsymbol{A}[1 . . n])$ : length of longest palindromic subsequence of $\boldsymbol{A}$.

## Algorithms \& Models of Computation <br> CS/ECE 374, Fall 2020 <br> 14.2 <br> Edit Distance and Sequence Alignment

## Algorithms \& Models of Computation

## CS/ECE 374, Fall 2020

14.2.1

Problem definition and background

## Spell Checking Problem

Given a string "exponen" that is not in the dictionary, how should a spell checker suggest a nearby string?

What does nearness mean?

Question: Given two strings $x_{1} x_{2} \ldots x_{n}$ and $y_{1} y_{2} \ldots y_{m}$ what is a distance between them?

Edit Distance: minimum number of "edits" to transform $x$ into $y$

## Spell Checking Problem

Given a string "exponen" that is not in the dictionary, how should a spell checker suggest a nearby string?

What does nearness mean?

Question: Given two strings $x_{1} x_{2} \ldots x_{\boldsymbol{n}}$ and $y_{1} y_{2} \ldots y_{\boldsymbol{m}}$ what is a distance between them?

Edit Distance: minimum number of "edits" to transform $x$ into $y$.

## Spell Checking Problem

Edit Distance: minimum number of "edits" to transform $x$ into $y$.

## Edit Distance

## Definition

Edit distance between two words $X$ and $\boldsymbol{Y}$ is the number of letter insertions, letter deletions and letter substitutions required to obtain $\boldsymbol{Y}$ from $\boldsymbol{X}$.

## Example

The edit distance between FOOD and MONEY is at most 4:

$$
\underline{\text { FOOD }} \rightarrow \text { MOODD } \rightarrow \text { MONOD } \rightarrow \text { MONED } \rightarrow \text { MONEY }
$$

## Edit Distance: Alternate View

## Alignment

Place words one on top of the other, with gaps in the first word indicating insertions, and gaps in the second word indicating deletions.

| F | $\mathbf{O}$ | $\mathbf{O}$ |  | D |
| :---: | :---: | :---: | :---: | :---: |
| M | $\mathbf{O}$ | N | E | Y |

Formally, an alignment is a set $M$ of pairs $(i, j)$ such that each index appears at most once, and there is no "crossing": $i<i^{\prime}$ and $i$ is matched to $i$ implies $i$ ' is matched to $j^{\prime}>j$. In the above example, this is $M=\{(1,1),(2,2),(3,3),(4,5)\}$. Cost of an alignment is the number of mismatched columns plus number of unmatched indices in both strings.

## Edit Distance Problem

## Problem

Given two words, find the edit distance between them, i.e., an alignment of smallest cost.

## Applications

(1) Spell-checkers and Dictionaries
(2) Unix diff

- DNA sequence alignment ... but, we need a new metric

## Similarity Metric

## Definition

For two strings $X$ and $Y$, the cost of alignment $M$ is
(1) [Gap penalty] For each gap in the alignment, we incur a cost $\delta$.
(2) [Mismatch cost] For each pair $\boldsymbol{p}$ and $\boldsymbol{q}$ that have been matched in $M$, we incur cost $\alpha_{p q}$; typically $\alpha_{p p}=0$.
Edit distance is special case when $\delta=\alpha_{p q}$

## Similarity Metric

## Definition

For two strings $X$ and $Y$, the cost of alignment $M$ is
(1) [Gap penalty] For each gap in the alignment, we incur a cost $\boldsymbol{\delta}$.
(2) [Mismatch cost] For each pair $\boldsymbol{p}$ and $\boldsymbol{q}$ that have been matched in $M$, we incur cost $\alpha_{\boldsymbol{p} \boldsymbol{q}}$; typically $\boldsymbol{\alpha}_{\boldsymbol{p} \boldsymbol{p}}=0$.
Edit distance is special case when $\boldsymbol{\delta}=\boldsymbol{\alpha}_{\boldsymbol{p} \boldsymbol{q}}=1$.

## THE END

(for now)

## Algorithms \& Models of Computation

## CS/ECE 374, Fall 2020

14.2.2

Edit distance as alignment

## An Example

## Example

$$
\begin{array}{l|l|l|l|l|l|l|l|l|l|l}
o & & c & u & r & r & a & n & c & e & \\
o & c & c & u & r & r & e & n & c & e & \text { Cost }=\boldsymbol{\delta}+\alpha_{a e}
\end{array}
$$

Alternative:

Or a really stupid solution (delete string, insert other string):

$$
\begin{array}{l|l|l|l|l|l|l|l|l|l|l|l|l|l|l|l|l|l|l}
o & c & u & r & r & a & n & c & e & & & & & & & & & & \\
& & & & & & &
\end{array}
$$

Cost $=19 \boldsymbol{\delta}$.

## What is the edit distance between...

## Sequence Alignment

Input Given two words $\boldsymbol{X}$ and $\boldsymbol{Y}$, and gap penalty $\delta$ and mismatch costs $\alpha_{p q}$ Goal Find alignment of minimum cost

## Sequence Alignment in Practice

(1) Typically the DNA sequences that are aligned are about $10^{5}$ letters long!
(2) So about $10^{10}$ operations and $10^{10}$ bytes needed
(3) The killer is the 10 GB storage
(1) Can we reduce space requirements?

## THE END

(for now)

## Algorithms \& Models of Computation

## CS/ECE 374, Fall 2020

### 14.2.3

Edit distance: The algorithm

## Edit distance

## Basic observation

Let $\boldsymbol{X}=\boldsymbol{\alpha} \boldsymbol{x}$ and $\boldsymbol{Y}=\boldsymbol{\beta} \boldsymbol{y}$
$\boldsymbol{\alpha}, \boldsymbol{\beta}$ : strings.
$x$ and $y$ single characters.
Think about optimal edit distance between $X$ and $Y$ as alignment, and consider last column of alignment of the two strings:

| $\alpha$ | $x$ |
| :---: | :---: |
| $\beta$ | $y$ |

or

| $\alpha$ | $x$ |
| :---: | :---: |
| $\beta y$ |  |

or

| $\alpha x$ |  |
| :---: | :---: |
| $\beta$ | $y$ |

## Observation

Prefixes must have optimal alignment!

## Problem Structure

## Observation

Let $\boldsymbol{X}=\boldsymbol{x}_{1} \boldsymbol{x}_{2} \cdots \boldsymbol{x}_{\boldsymbol{m}}$ and $\boldsymbol{Y}=\boldsymbol{y}_{1} \boldsymbol{y}_{2} \cdots \boldsymbol{y}_{\boldsymbol{n}}$. If $(\boldsymbol{m}, \boldsymbol{n})$ are not matched then either the $m$ th position of $\boldsymbol{X}$ remains unmatched or the $n$th position of $Y$ remains unmatched.
(1) Case $x_{m}$ and $y_{n}$ are matched.
(1) Pay mismatch cost $\alpha_{x_{m} y_{n}}$ plus cost of aligning strings $\boldsymbol{x}_{1} \cdots x_{m-1}$ and $y_{1} \cdots y_{n-1}$
(2) Case $\boldsymbol{x}_{\boldsymbol{m}}$ is unmatched.
(1) Pay gap penalty plus cost of aligning $\boldsymbol{x}_{1} \cdots \boldsymbol{x}_{\boldsymbol{m}-1}$ and $\boldsymbol{y}_{1} \cdots \boldsymbol{y}_{\boldsymbol{n}}$
(3) Case $y_{n}$ is unmatched.
(1) Pay gap penalty plus cost of aligning $\boldsymbol{x}_{1} \cdots \boldsymbol{x}_{\boldsymbol{m}}$ and $\boldsymbol{y}_{1} \cdots \boldsymbol{y}_{\boldsymbol{n}-1}$

## Subproblems and Recurrence

| $x_{1} \ldots x_{\boldsymbol{i}-1}$ | $x_{\boldsymbol{i}}$ |
| :---: | :---: | :---: |
| $y_{1} \ldots y_{\boldsymbol{j}-1}$ | $y_{\boldsymbol{j}}$ |$\quad$ or $\quad$| $x_{1} \ldots x_{\boldsymbol{i}-1}$ | $x^{2}$ |
| :---: | :---: | :---: |
| $y_{1} \ldots y_{\boldsymbol{j}-1} y_{\boldsymbol{j}}$ |  |$\quad$ or $\quad$| $x_{1} \ldots x_{\boldsymbol{i}-1} x_{\boldsymbol{i}}$ |
| :---: |
| $y_{1} \ldots y_{\boldsymbol{j}-1}$ |

## Optimal Costs

Let $\operatorname{Opt}(\boldsymbol{i}, \boldsymbol{j})$ be optimal cost of aligning $x_{1} \cdots x_{\boldsymbol{i}}$ and $\boldsymbol{y}_{1} \cdots y_{j}$. Then

$$
\operatorname{Opt}(i, j)=\min \left\{\begin{array}{l}
\alpha_{x_{i_{y}} y_{j}}+\mathbf{O p t}(i-1, j-1) \\
\delta+\operatorname{Opt}(i-1, j), \\
\delta+\operatorname{Opt}(i, j-1)
\end{array}\right.
$$

## Subproblems and Recurrence

| $x_{1} \ldots x_{i-1}$ | $x_{i}$ |
| :---: | :---: | :---: |
| $y_{1} \ldots y_{j-1}$ | $y_{j}$ | or $\quad$| $x_{1} \ldots x_{i-1}$ | $x$ |
| :---: | :---: | :---: |
| $y_{1} \ldots y_{j-1} y_{j}$ |  |$\quad$ or $\quad$| $x_{1} \ldots x_{i-1} x_{i}$ |
| :---: |
| $y_{1} \ldots y_{j-1}$ |

## Optimal Costs

Let $\operatorname{Opt}(\boldsymbol{i}, \boldsymbol{j})$ be optimal cost of aligning $x_{1} \cdots x_{\boldsymbol{i}}$ and $\boldsymbol{y}_{1} \cdots y_{j}$. Then

$$
\operatorname{Opt}(i, j)=\min \left\{\begin{array}{l}
\alpha_{x_{i} y_{j}}+\mathbf{O p t}(i-1, j-1) \\
\delta+\operatorname{Opt}(i-1, j) \\
\delta+\operatorname{Opt}(i, j-1)
\end{array}\right.
$$

Base Cases: $\mathbf{O p t}(\boldsymbol{i}, 0)=\boldsymbol{\delta} \cdot \boldsymbol{i}$ and $\mathbf{O p t}(0, \boldsymbol{j})=\boldsymbol{\delta} \cdot \boldsymbol{j}$

## Recursive Algorithm

Assume $X$ is stored in array $A[1 . . m]$ and $Y$ is stored in $B[1 . . n]$
Array COST stores cost of matching two chars. Thus $\operatorname{COST}[a, b]$ give the cost of matching character $\boldsymbol{a}$ to character $\boldsymbol{b}$.

```
\(\operatorname{EDIST}(A[1 . . m], B[1 . . n])\)
    If ( \(\boldsymbol{m}=0\) ) return \(\boldsymbol{n} \boldsymbol{\delta}\)
    If ( \(\boldsymbol{n}=0\) ) return \(\boldsymbol{m} \boldsymbol{\delta}\)
    \(\boldsymbol{m}_{1}=\boldsymbol{\delta}+\operatorname{EDIST}(\boldsymbol{A}[1 . .(\boldsymbol{m}-1)], B[1 . . n])\)
    \(\left.\boldsymbol{m}_{2}=\boldsymbol{\delta}+\operatorname{EDIST}(\boldsymbol{A}[1 . . m], B[1 . .(n-1)])\right)\)
    \(m_{3}=\operatorname{COST}[A[m], B[n]]+\operatorname{EDIST}(A[1 . .(m-1)], B[1 . .(n-1)])\)
    return \(\min \left(\boldsymbol{m}_{1}, \boldsymbol{m}_{2}, \boldsymbol{m}_{3}\right)\)
```

Example: DEED and DREAD

|  | $\varepsilon$ | $D$ | $R$ | $E$ | $A$ | $D$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\varepsilon$ |  |  |  |  |  |  |
| $D$ |  |  |  |  |  |  |

## As part of the input...

## The cost of aligning a character against another character

$\Sigma$ : Alphabet
We are given a cost function (in a table):
$\forall b, c \in \Sigma \quad \operatorname{COST}[b][c]=\operatorname{cost}$ of aligning $b$ with $c$.
$\forall b \in \Sigma$
$\operatorname{COST}[b][b]=0$
$\boldsymbol{\delta}$ : price of deletion of insertion of a single character

## Memoizing the Recursive Algorithm (Explicit Memoization)

Input: Two strings

$$
\begin{aligned}
& A[1 \ldots m] \\
& B[1 \ldots . n]
\end{aligned}
$$

$$
\begin{aligned}
& \text { EditDistance }(\boldsymbol{A}, \boldsymbol{B}) \\
& \quad \text { int } \boldsymbol{M}[0 . . \boldsymbol{m}][0 . . \boldsymbol{n}] \\
& \forall \boldsymbol{i}, \boldsymbol{j} \quad \boldsymbol{M}[\boldsymbol{i}][j] \leftarrow \infty \\
& \text { return } \operatorname{edEMI}(\boldsymbol{m}, \boldsymbol{n})
\end{aligned}
$$

```
edEMI(i,j) // A[1...i],B[1...j]
    if M[i][j]<\infty
        return M[i][j] // stored value
    if i=0 or }\boldsymbol{j}=
        M[i][j]=(i+j)\delta
        return M[i][j]
```

$$
\begin{aligned}
& \boldsymbol{m}_{1}=\boldsymbol{\delta}+\operatorname{edEMI}(\boldsymbol{i}-1, \boldsymbol{j}) \\
& \boldsymbol{m}_{2}=\boldsymbol{\delta}+\operatorname{edEMI}(\boldsymbol{i}, \boldsymbol{j}-1)
\end{aligned}
$$

$$
\boldsymbol{m}_{3}=\operatorname{COST}[\boldsymbol{A}[i]][B[j]]
$$

$$
+\operatorname{edEMI}(\boldsymbol{i}-1, \boldsymbol{j}-1)
$$

$$
M[i][j]=\min \left(\boldsymbol{m}_{1}, \boldsymbol{m}_{2}, \boldsymbol{m}_{3}\right)
$$

$$
\text { return } M[i][j]
$$

    return \(M[i][j]\)
    
## Dynamic program for edit distance

        for \(\boldsymbol{j}=1\) to \(\boldsymbol{n}\) do
            \(M[i][j]=\min \left\{\begin{array}{l}\operatorname{COST}[\boldsymbol{A}[\boldsymbol{i}]][\boldsymbol{B}[\boldsymbol{j}]]+\boldsymbol{M}[\boldsymbol{i}-1][\boldsymbol{j}-1], \\ \boldsymbol{\delta}+\boldsymbol{M}[\boldsymbol{i}-1][\boldsymbol{j}], \\ \delta+\boldsymbol{M}[\boldsymbol{i}][\boldsymbol{j}-1]\end{array}\right.\)
```

## Analysis

(1) Running time is $O(m n)$.
(2) Space used is $\mathrm{O}(\mathrm{mn})$.

## THE END

(for now)

## Algorithms \& Models of Computation

## CS/ECE 374, Fall 2020

### 14.2.5 <br> Reducing space for edit distance

## Matrix and DAG of computation of edit distance

Figure: Iterative algorithm in previous slide computes values in row order.

## Optimizing Space

(1) Recall

$$
M(i, j)=\min \left\{\begin{array}{l}
\alpha_{x_{i} y_{j}}+M(i-1, j-1) \\
\delta+M(i-1, j) \\
\delta+M(i, j-1)
\end{array}\right.
$$

(2) Entries in $j$ th column only depend on $(j-1)$ st column and earlier entries in $j$ th column
(0) Only store the current column and the previous column reusing space; $N(i, 0)$ stores $M(i, j-1)$ and $N(i, 1)$ stores $M(i, j)$

Example: DEED vs. BREAD filled by column

|  | $\varepsilon$ | $D$ | $R$ | $E$ | $A$ | $D$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\varepsilon$ |  |  |  |  |  |  |
| $D$ |  |  |  |  |  |  |
| $E$ |  |  |  |  |  |  |
| $E$ |  |  |  |  |  |  |
| $D$ |  |  |  |  |  |  |

Example: DEED vs. BREAD filled by column

|  | $\boldsymbol{\varepsilon}$ | $\boldsymbol{D}$ | $\boldsymbol{R}$ | $\boldsymbol{E}$ | $\boldsymbol{A}$ | $\boldsymbol{D}$ |

| $\boldsymbol{D}$ | 3 | 3 | 3 | 2 | 2 | 2 |

## Computing in column order to save space

Figure: $\boldsymbol{M}(\boldsymbol{i}, \boldsymbol{j})$ only depends on previous column values. Keep only two columns and compute in column order.

## Space Efficient Algorithm

$$
\begin{aligned}
& \text { for all } \boldsymbol{i} \text { do } \boldsymbol{N}[\boldsymbol{i}, 0]=\boldsymbol{i} \boldsymbol{\delta} \\
& \text { for } \boldsymbol{j}=1 \text { to } \boldsymbol{n} \text { do } \\
& \boldsymbol{N}[0,1]=\boldsymbol{j} \boldsymbol{\delta} \text { (* corresponds to } \boldsymbol{M}(0, \boldsymbol{j}) *) \\
& \text { for } \boldsymbol{i}=1 \text { to } \boldsymbol{m} \text { do } \\
& \qquad \begin{array}{l}
\boldsymbol{N}[\boldsymbol{i}, 1]=\min \left\{\begin{array}{l}
\boldsymbol{\alpha}_{x_{i} y_{\boldsymbol{j}}}+\boldsymbol{N}[\boldsymbol{i}-1,0] \\
\boldsymbol{\delta}+\boldsymbol{N}[\boldsymbol{i}-1,1] \\
\boldsymbol{\delta}+\boldsymbol{N}[\boldsymbol{i}, 0]
\end{array}\right. \\
\text { for } \boldsymbol{i}=1 \text { to } \boldsymbol{m} \text { do } \\
\text { Copy } \boldsymbol{N}[\boldsymbol{i}, 0]=\boldsymbol{N}[\boldsymbol{i}, 1]
\end{array}
\end{aligned}
$$

## Analysis

Running time is $O(m n)$ and space used is $O(2 m)=O(m)$

## Analyzing Space Efficiency

(1) From the $\boldsymbol{m} \times n$ matrix $M$ we can construct the actual alignment (exercise)
(2) Matrix $N$ computes cost of optimal alignment but no way to construct the actual alignment
(0) Space efficient computation of alignment? More complicated algorithm - see notes and Kleinberg-Tardos book.

## THE END

## Algorithms \& Models of Computation <br> CS/ECE 374, Fall 2020 <br> 14.2.6 <br> Longest Common Subsequence Problem

## LCS Problem

## Definition

LCS between two strings $X$ and $Y$ is the length of longest common subsequence between $\boldsymbol{X}$ and $\boldsymbol{Y}$.

## ABAZDC BACBAD

ABAZDC BACBAD

## Example <br> LCS between ABAZDC and BACBAD is 4 via ABAD

Derive a dynamic programming algorithm for the problem.

## LCS Problem

## Definition

LCS between two strings $X$ and $Y$ is the length of longest common subsequence between $\boldsymbol{X}$ and $\boldsymbol{Y}$.

$$
\begin{array}{ll}
A B A Z D C & A B A Z D C \\
B A C B A D & B A C B A D
\end{array}
$$

## Example <br> LCS between ABAZDC and BACBAD is 4 via ABAD

Derive a dynamic programming algorithm for the problem.

## LCS Problem

## Definition

LCS between two strings $X$ and $Y$ is the length of longest common subsequence between $\boldsymbol{X}$ and $\boldsymbol{Y}$.
$A B A Z D C$
$B A C B A D$

## ABAZDC BACBAD

## Example <br> LCS between ABAZDC and BACBAD is 4 via ABAD

Derive a dynamic programming algorithm for the problem.

LCS recursive definition
$A[1 . . n], B[1 . . m]$ : Input strings.

$$
\operatorname{LCS}(i, j)= \begin{cases}0 & i=0 \text { or } j=0 \\
\max \binom{\operatorname{LCS}(i-1, j),}{\operatorname{LCS}(i, j-1)} & A[i] \neq B[j] \\
\max \left(\begin{array}{c}
L C S(i-1, j), \\
\operatorname{LCS}(i, j-1), \\
1+\operatorname{LCS}(i-1, j-1)
\end{array}\right) & A[i]=B[j]\end{cases}
$$

Similar to edit distance... $O(n m)$ time algorithm $O(m)$ space.

LCS recursive definition
$A[1 . . n], B[1 . . m]$ : Input strings.

$$
\operatorname{LCS}(i, j)= \begin{cases}0 & i=0 \text { or } j=0 \\
\max \binom{\operatorname{LCS}(i-1, j),}{\operatorname{LCS}(i, j-1)} & A[i] \neq B[j] \\
\max \left(\begin{array}{c}
\operatorname{LCS}(i-1, j), \\
\operatorname{LCS}(i, j-1), \\
1+\operatorname{LCS}(i-1, j-1)
\end{array}\right) & A[i]=B[j]\end{cases}
$$

Similar to edit distance... $O(n m)$ time algorithm $O(m)$ space.

Longest common subsequence is just edit distance for the two sequences...
$A, B$ : input sequences
$\Sigma$ : "alphabet" all the different values in $\boldsymbol{A}$ and $\boldsymbol{B}$

$$
\begin{array}{ll}
\forall b, c \in \Sigma: b \neq c & \operatorname{COST}[b][c]=+\infty \\
\forall b \in \Sigma & \operatorname{COST}[b][b]=1
\end{array}
$$

1: price of deletion of insertion of a single character

Length of longest common subsequence $=m+n-\operatorname{ed}(A, B)$

Longest common subsequence is just edit distance for the two sequences...
$A, B$ : input sequences
$\Sigma$ : "alphabet" all the different values in $\boldsymbol{A}$ and $\boldsymbol{B}$

$$
\begin{array}{ll}
\forall b, c \in \Sigma: b \neq c & \operatorname{COST}[b][c]=+\infty \\
\forall b \in \Sigma & \operatorname{COST}[b][b]=1
\end{array}
$$

1: price of deletion of insertion of a single character

Length of longest common subsequence $=\boldsymbol{m}+\boldsymbol{n}-\mathbf{e d}(A, B)$

Maximum Weighted Independent Set in Trees

## Maximum Weight Independent Set Problem

Input Graph $G=(\boldsymbol{V}, \boldsymbol{E})$ and weights $\boldsymbol{w}(\boldsymbol{v}) \geq 0$ for each $\boldsymbol{v} \in \boldsymbol{V}$
Goal Find maximum weight independent set in $G$

## Maximum weight independent set in above graph: $\{B, D\}$

## Maximum Weight Independent Set Problem

Input Graph $G=(\boldsymbol{V}, \boldsymbol{E})$ and weights $\boldsymbol{w}(\boldsymbol{v}) \geq 0$ for each $\boldsymbol{v} \in \boldsymbol{V}$
Goal Find maximum weight independent set in $G$

Maximum weight independent set in above graph: $\{B, D\}$

## Maximum Weight Independent Set in a Tree

Input Tree $\boldsymbol{T}=(\boldsymbol{V}, \boldsymbol{E})$ and weights $\boldsymbol{w}(\boldsymbol{v}) \geq 0$ for each $\boldsymbol{v} \in \boldsymbol{V}$
Goal Find maximum weight independent set in $T$

Maximum weight independent set in above tree: ??

## Towards a Recursive Solution

For an arbitrary graph $G$ :
(1) Number vertices as $v_{1}, v_{2}, \ldots, v_{n}$
(2) Find recursively optimum solutions without $v_{n}$ (recurse on $G-v_{n}$ ) and with $v_{n}$ (recurse on $G-v_{n}-N\left(v_{n}\right) \&$ include $v_{n}$ ).
(0) Saw that if graph $G$ is arbitrary there was no good ordering that resulted in a small number of subproblems.

What about a tree? Natural candidate for $v_{n}$ is root $r$ of $T$ ?

## Towards a Recursive Solution

For an arbitrary graph $G$ :
(1) Number vertices as $v_{1}, v_{2}, \ldots, v_{n}$
(2) Find recursively optimum solutions without $v_{n}$ (recurse on $G-v_{n}$ ) and with $v_{n}$ (recurse on $G-v_{n}-N\left(v_{n}\right) \&$ include $v_{n}$ ).

## Example

## A Recursive Solution

$\boldsymbol{T}(\boldsymbol{u})$ : subtree of $\boldsymbol{T}$ hanging at node $\boldsymbol{u}$ OPT(u): max weighted independent set value in $\boldsymbol{T}(\boldsymbol{u})$

$$
\boldsymbol{O P T}(\boldsymbol{u})=\max \left\{\begin{array}{l}
\sum_{v} \text { child of } u \text { OPT }(v), \\
w(u)+\sum_{v} \text { grandchild of } u \text { OPT(v) }
\end{array}\right.
$$

## A Recursive Solution

$\boldsymbol{T}(\boldsymbol{u})$ : subtree of $\boldsymbol{T}$ hanging at node $\boldsymbol{u}$ OPT(u): max weighted independent set value in $\boldsymbol{T}(\boldsymbol{u})$

$$
O P T(u)=\max \left\{\begin{array}{l}
\sum_{v} \text { child of } u \\
w(u)+\sum_{v} O P T(v) \\
\\
\end{array}\right.
$$

## Iterative Algorithm

(1) Compute $\operatorname{OPT}(\boldsymbol{u})$ bottom up. To evaluate $\operatorname{OPT}(\boldsymbol{u})$ need to have computed values of all children and grandchildren of $u$
(2) What is an ordering of nodes of a tree $\boldsymbol{T}$ to achieve above?

Post-order traversal of
a tree.

## Iterative Algorithm

(1) Compute $\operatorname{OPT}(\boldsymbol{u})$ bottom up. To evaluate $\operatorname{OPT}(\boldsymbol{u})$ need to have computed values of all children and grandchildren of $u$
(2) What is an ordering of nodes of a tree $\boldsymbol{T}$ to achieve above? Post-order traversal of a tree.

## Iterative Algorithm

MIS-Tree ( $\boldsymbol{T}$ ) :
Let $\boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}}$ be a post-order traversal of nodes of T for $\boldsymbol{i}=1$ to $\boldsymbol{n}$ do

$$
\begin{aligned}
& \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{i}}\right]=\max \binom{\sum_{\boldsymbol{v}_{\boldsymbol{j}} \text { child of } \boldsymbol{v}_{\boldsymbol{i}}} \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{j}}\right],}{\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{\boldsymbol{j}} \text { grandchild of } \boldsymbol{v}_{\boldsymbol{i}}} \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{j}}\right]} \\
& \text { return } \left.\boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{n}}\right] \text { (* Note: } \boldsymbol{v}_{\boldsymbol{n}} \text { is the root of } \boldsymbol{T} *\right)
\end{aligned}
$$

Space: $O(n)$ to store the value at each node of $T$
Running time
(1) Naive bound: $O\left(n^{2}\right)$ since each $M\left[v_{i}\right]$ evaluation may take $O(n)$ time and there are $n$ evaluations.
(2) Better bound: $O(n)$. A value $M\left[v_{j}\right]$ is accessed only by its parent and grand parent.

## Iterative Algorithm

## MIS-Tree ( $\boldsymbol{T}$ ) :

Let $\boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}}$ be a post-order traversal of nodes of T for $\boldsymbol{i}=1$ to $\boldsymbol{n}$ do

$$
\begin{aligned}
& \quad \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{i}}\right]=\max \binom{\sum_{\boldsymbol{v}_{\boldsymbol{j}} \text { child of } \boldsymbol{v}_{\boldsymbol{i}}} \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{j}}\right],}{\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{\boldsymbol{j}} \text { grandchild of } \boldsymbol{v}_{\boldsymbol{i}}} \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{j}}\right]} \\
& \text { return } \left.\boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{n}}\right] \text { (* Note: } \boldsymbol{v}_{\boldsymbol{n}} \text { is the root of } \boldsymbol{T} *\right)
\end{aligned}
$$

Space: $O(n)$ to store the value at each node of $T$
(1) Naive bound: $O\left(n^{2}\right)$ since each $M\left[v_{i}\right]$ evaluation may take $O(n)$ time and there are $\boldsymbol{n}$ evaluations.
(2) Better bound: $O(n)$. A value $M\left[v_{j}\right]$ is accessed only by its parent and grand parent.

## Iterative Algorithm

$$
\begin{aligned}
& \text { MIS-Tree }(\boldsymbol{T}): \\
& \text { Let } \boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}} \text { be a post-order traversal of nodes of } \mathrm{T} \\
& \text { for } \boldsymbol{i}=1 \text { to } \boldsymbol{n} \text { do } \\
& \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{i}}\right]=\max \binom{\sum_{v_{j} \text { child of } \boldsymbol{v}_{\boldsymbol{i}}} \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{j}}\right],}{\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{j} \text { grandchild of } \boldsymbol{v}_{\boldsymbol{i}}} \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{j}}\right]} \\
& \text { return } \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{n}}\right]\left(* \text { Note: } \boldsymbol{v}_{\boldsymbol{n}} \text { is the root of } \boldsymbol{T} *\right)
\end{aligned}
$$

Space: $\boldsymbol{O}(\boldsymbol{n})$ to store the value at each node of $\boldsymbol{T}$ Running time:
(1) Naive bound: $O\left(n^{2}\right)$ since each $M\left[v_{i}\right]$ evaluation may take $O(n)$ time and there are $n$ evaluations.
(2) Better bound: $\boldsymbol{O}(\boldsymbol{n})$. A value $M\left[v_{j}\right]$ is accessed only by its parent and grand parent.

## Iterative Algorithm

```
MIS-Tree ( \(\boldsymbol{T}\) ) :
    Let \(\boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}}\) be a post-order traversal of nodes of T
    for \(\boldsymbol{i}=1\) to \(\boldsymbol{n}\) do
        \(\boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{i}}\right]=\max \binom{\sum_{\boldsymbol{v}_{j} \text { child of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{j}}\right]}{,\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{j} \text { grandchild of } \boldsymbol{v}_{\boldsymbol{i}}} \boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{j}}\right]}\)
return \(M\left[v_{n}\right]\) (* Note: \(\boldsymbol{v}_{\boldsymbol{n}}\) is the root of \(\boldsymbol{T} *\) )
```

Space: $\boldsymbol{O}(\boldsymbol{n})$ to store the value at each node of $\boldsymbol{T}$ Running time:
(1) Naive bound: $O\left(n^{2}\right)$ since each $M\left[v_{i}\right]$ evaluation may take $O(n)$ time and there are $\boldsymbol{n}$ evaluations.
(3) Better bound: $O(n)$. A value $M\left[v_{j}\right]$ is accessed only by its parent and grand parent.

## Iterative Algorithm

```
MIS-Tree ( \(\boldsymbol{T}\) ) :
    Let \(\boldsymbol{v}_{1}, \boldsymbol{v}_{2}, \ldots, \boldsymbol{v}_{\boldsymbol{n}}\) be a post-order traversal of nodes of T
    for \(\boldsymbol{i}=1\) to \(\boldsymbol{n}\) do
        \(\boldsymbol{M}\left[\boldsymbol{v}_{i}\right]=\max \binom{\sum_{v_{j} \text { child of } \boldsymbol{v}_{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right]}{,\boldsymbol{w}\left(\boldsymbol{v}_{\boldsymbol{i}}\right)+\sum_{\boldsymbol{v}_{j} \text { grandchild of }} \boldsymbol{v}_{\boldsymbol{i}} \boldsymbol{M}\left[\boldsymbol{v}_{j}\right]}\)
return \(\boldsymbol{M}\left[\boldsymbol{v}_{\boldsymbol{n}}\right]\) (* Note: \(\boldsymbol{v}_{\boldsymbol{n}}\) is the root of \(\boldsymbol{T} *\) )
```

Space: $\boldsymbol{O}(\boldsymbol{n})$ to store the value at each node of $\boldsymbol{T}$ Running time:

## Example

## THE END

(for now)

## Algorithms \& Models of Computation CS/ECE 374, Fall 2020 <br> 14.4 <br> Dynamic programming and DAGs

## Takeaway Points

(1) Dynamic programming is based on finding a recursive way to solve the problem. Need a recursion that generates a small number of subproblems.
(2) Given a recursive algorithm there is a natural DAG associated with the subproblems that are generated for given instance; this is the dependency graph. An iterative algorithm simply evaluates the subproblems in some topological sort of this DAG.
(3) The space required to evaluate the answer can be reduced in some cases by a careful examination of that dependency DAG of the subproblems and keeping only a subset of the DAG at any time.
