

Solved problem

1 *C comments* are the set of strings over alphabet $\Sigma = \{*, /, A, \square, \langle\langle\text{Enter}\rangle\rangle\}$ that form a proper comment in the C program language and its descendants, like C++ and Java. Here $\langle\langle\text{Enter}\rangle\rangle$ represents the newline character, \square represents any other whitespace character (like the space and tab characters), and A represents any non-whitespace character other than $*$ or $/$.¹ There are two types of C comments:

- Line comments: Strings of the form $// \dots \langle\langle\text{Enter}\rangle\rangle$.
- Block comments: Strings of the form $/* \dots */$.

Following the C99 standard, we explicitly disallow *nesting* comments of the same type. A line comment starts with $//$ and ends at the first $\langle\langle\text{Enter}\rangle\rangle$ after the opening $//$. A block comment starts with $/*$ and ends at the first $*/$ completely after the opening $/*$; in particular, every block comment has at least two $*$ s. For example, each of the following strings is a valid C comment:

- $/* */$
- $// \square / \square \langle\langle\text{Enter}\rangle\rangle$
- $/* // \square * \square \langle\langle\text{Enter}\rangle\rangle * */$
- $/* \square / \square \langle\langle\text{Enter}\rangle\rangle \square * /$

On the other hand, *none* of the following strings is a valid C comments:

- $/* /$
- $// \square / \square \langle\langle\text{Enter}\rangle\rangle \square \langle\langle\text{Enter}\rangle\rangle$
- $/* \square / * \square * / \square * /$

1.A. Describe a DFA that accepts the set of all C comments.

1.B. Describe a DFA that accepts the set of all strings composed entirely of blanks (\square), newlines ($\langle\langle\text{Enter}\rangle\rangle$), and C comments.

You must explain in English how your DFAs work. Drawings or formal descriptions without English explanations will receive no credit, even if they are correct.

¹The actual C commenting syntax is considerably more complex than described here, because of character and string literals.

- The opening $/*$ or $//$ of a comment must not be inside a string literal ($" \dots "$) or a (multi-)character literal ($' \dots '$).
- The opening double-quote of a string literal must not be inside a character literal ($' \dots '$) or a comment.
- The closing double-quote of a string literal must not be escaped (\backslash)
- The opening single-quote of a character literal must not be inside a string literal ($" \dots ' \dots "$) or a comment.
- The closing single-quote of a character literal must not be escaped (\backslash)

Solution:

- 1.A. The following eight-state DFA recognizes the language of C comments. All missing transitions lead to a hidden reject state.

The states are labeled mnemonically as follows:

- **s** - We have not read anything.
- **/** - We just read the initial **/**.
- **//** - We are reading a line comment.
- **L** - We have read a complete line comment.
- **/*** - We are reading a block comment, and we did not just read a ***** after the opening **/***.
- **/**** - We are reading a block comment, and we just read a ***** after the opening **/***.
- **B** - We have read a complete block comment.

- 1.B. By merging the accepting states of the previous DFA with the start state and adding white-space transitions at the start state, we obtain the following six-state DFA. Again, all missing transitions lead to a hidden reject state.

- A backslash escapes the next symbol if and only if it is not itself escaped (`\\`) or inside a comment.

For example, the string `"/ * \\ " * / " * " / * " / * " * /` is a valid string literal (representing the 5-character string `/*"\"*/`, which is itself a valid block comment!) followed immediately by a valid block comment. **For this homework question, just pretend that the characters `'`, `"`, and `\` don't exist.**

Commenting in C++ is even more complicated, thanks to the addition of *raw* string literals. Don't ask.

Some C and C++ compilers do support nested block comments, in violation of the language specification. A few other languages, like OCaml, explicitly allow nesting block comments.

The states are labeled mnemonically as follows:

- s - We are between comments.
- $/$ - We just read the initial $/$ of a comment.
- $//$ - We are reading a line comment.
- $/*$ - We are reading a block comment, and we did not just read a $*$ after the opening $/*$.
- $/**$ - We are reading a block comment, and we just read a $*$ after the opening $/*$.

Rubric: 10 points = 5 for each part, using the standard DFA design rubric (scaled)

Rubric:[DFA design] For problems worth 10 points:

- 2 points for an unambiguous description of a DFA, including the states set Q , the start state s , the accepting states A , and the transition function δ .
 - **For drawings:** Use an arrow from nowhere to indicate s , and doubled circles to indicate accepting states A . If $A = \emptyset$, say so explicitly. If your drawing omits a reject state, say so explicitly. **Draw neatly!** If we can't read your solution, we can't give you credit for it,.
 - **For text descriptions:** You can describe the transition function either using a 2d array, using mathematical notation, or using an algorithm.
 - **For product constructions:** You must give a complete description of the states and transition functions of the DFAs you are combining (as either drawings or text), together with the accepting states of the product DFA.
- **Homework only:** 4 points for *briefly* and correctly explaining the purpose of each state *in English*. This is how you justify that your DFA is correct.
 - For product constructions, explaining the states in the factor DFAs is enough.
 - **Deadly Sin:** (“Declare your variables.”) No credit for the problem if the English description is missing, *even if the DFA is correct*.
- 4 points for correctness. (8 points on exams, with all penalties doubled)
 - -1 for a single mistake: a single misdirected transition, a single missing or extra accept state, rejecting exactly one string that should be accepted, or accepting exactly one string that should be accepted.
 - -2 for incorrectly accepting/rejecting more than one but a finite number of strings.
 - -4 for incorrectly accepting/rejecting an infinite number of strings.
- DFA drawings with too many states may be penalized. DFA drawings with *significantly* too many states may get no credit at all.
- Half credit for describing an NFA when the problem asks for a DFA.
