

Prove that the following languages are undecidable.

See outline of how to solve such problems in the original problem set.

1 ACCEPTILLINI :=  $\{\langle M \rangle \mid M \text{ accepts the string } \textit{ILLINI}\}$

### Solution:

For the sake of argument, suppose there is an algorithm DECIDEACCEPTILLINI that correctly decides the language ACCEPTILLINI. Then we can solve the halting problem as follows:

<pre> <b>DecideHalt</b>(<math>\langle M, w \rangle</math>):   Encode the following Turing machine <math>M'</math>:   <table border="1"> <tr> <td> <pre> <math>M'(x)</math>:   run <math>M</math> on input <math>w</math>   return TRUE </pre> </td> </tr> </table>   if DECIDEACCEPTILLINI(<math>\langle M' \rangle</math>)     return TRUE   else     return FALSE </pre>	<pre> <math>M'(x)</math>:   run <math>M</math> on input <math>w</math>   return TRUE </pre>
<pre> <math>M'(x)</math>:   run <math>M</math> on input <math>w</math>   return TRUE </pre>	

We prove this reduction correct as follows:

- $\implies$  Suppose  $M$  halts on input  $w$ .  
 Then  $M'$  accepts *every* input string  $x$ .  
 In particular,  $M'$  accepts the string *ILLINI*.  
 So **DecideAcceptIllini** accepts the encoding  $\langle M' \rangle$ .  
 So **DecideHalt** correctly accepts the encoding  $\langle M, w \rangle$ .
- $\impliedby$  Suppose  $M$  does not halt on input  $w$ .  
 Then  $M'$  diverges on *every* input string  $x$ .  
 In particular,  $M'$  does not accept the string *ILLINI*.  
 So **DecideAcceptIllini** rejects the encoding  $\langle M' \rangle$ .  
 So **DecideHalt** correctly rejects the encoding  $\langle M, w \rangle$ .

In both cases, **DecideHalt** is correct. But that's impossible, because **Halt** is undecidable. We conclude that the algorithm **DecideAcceptIllini** does not exist.

As usual for undecidability proofs, this proof invokes *four* distinct Turing machines:

- The hypothetical algorithm **DecideAcceptIllini**.
- The new algorithm **DecideHalt** that we construct in the solution.
- The arbitrary machine  $M$  whose encoding is part of the input to **DecideHalt**.
- The special machine  $M'$  whose encoding **DecideHalt** constructs (from the encoding of  $M$  and  $w$ ) and then passes to **DecideAcceptIllini**.

2 ACCEPTTHREE :=  $\{\langle M \rangle \mid M \text{ accepts exactly three strings}\}$

## Solution:

For the sake of argument, suppose there is an algorithm **DecideAcceptThree** that correctly decides the language **ACCEPTTHREE**. Then we can solve the halting problem as follows:

```
DECIDEHALT( $\langle M, w \rangle$ ):
  Encode the following Turing machine  $M'$ :
   $M'(x)$ :
    run  $M$  on input  $w$ 
    if  $x = \varepsilon$  or  $x = 0$  or  $x = 1$ 
      return TRUE
    else
      return FALSE
  if DECIDEACCEPTTHREE( $\langle M' \rangle$ )
    return TRUE
  else
    return FALSE
```

We prove this reduction correct as follows:

$\implies$  Suppose  $M$  halts on input  $w$ .

Then  $M'$  accepts exactly three strings:  $\varepsilon$ ,  $0$ , and  $1$ .

So **DecideAcceptThree** accepts the encoding  $\langle M' \rangle$ .

So **DecideHalt** correctly accepts the encoding  $\langle M, w \rangle$ .

$\impliedby$  Suppose  $M$  does not halt on input  $w$ .

Then  $M'$  diverges on *every* input string  $x$ .

In particular,  $M'$  does not accept exactly three strings (because  $0 \neq 3$ ).

So **DecideAcceptThree** rejects the encoding  $\langle M' \rangle$ .

So **DecideHalt** correctly rejects the encoding  $\langle M, w \rangle$ .

In both cases, **DecideHalt** is correct. But that's impossible, because **HALT** is undecidable. We conclude that the algorithm **DecideAcceptThree** does not exist.

**3** **ACCEPTPALINDROME** :=  $\{\langle M \rangle \mid M \text{ accepts at least one palindrome}\}$

## Solution:

For the sake of argument, suppose there is an algorithm **DecideAcceptPalindrome** that correctly decides the language **AcceptPalindrome**. Then we can solve the halting problem as follows:

```
DECIDEHALT( $\langle M, w \rangle$ ):
  Encode the following Turing machine  $M'$ :
   $M'(x)$ :
    run  $M$  on input  $w$ 
    return TRUE
  if DECIDEACCEPTPALINDROME( $\langle M' \rangle$ )
    return TRUE
  else
    return FALSE
```

We prove this reduction correct as follows:

$\implies$  Suppose  $M$  halts on input  $w$ .

Then  $M'$  accepts *every* input string  $x$ .

In particular,  $M'$  accepts the palindrome *RACECAR*.

So **DecideAcceptPalindrome** accepts the encoding  $\langle M' \rangle$ .

So **DecideHalt** correctly accepts the encoding  $\langle M, w \rangle$ .

$\impliedby$  Suppose  $M$  does not halt on input  $w$ .

Then  $M'$  diverges on *every* input string  $x$ .

In particular,  $M'$  does not accept any palindromes.

So **DecideAcceptPalindrome** rejects the encoding  $\langle M' \rangle$ .

So **DecideHalt** correctly rejects the encoding  $\langle M, w \rangle$ .

In both cases, **DecideHalt** is correct. But that's impossible, because HALT is undecidable. We conclude that the algorithm **DecideAcceptPalindrome** does not exist.

Yes, this is *exactly* the same proof as for problem 1.
