# Reduction

Given 3-SAT formula  $\varphi$  create a graph  $G_\varphi$  such that

- $G_\varphi$  has a Hamiltonian cycle if and only if  $\varphi$  is satisfiable
- $G_\varphi$  should be constructible from  $\varphi$  by a polynomial time algorithm  $\mathcal{A}$

**Notation:**  $\varphi$  has  $n$  variables  $x_1, x_2, \dots, x_n$  and  $m$  clauses  $C_1, C_2, \dots, C_m$ .

# Reduction: First Ideas

- Viewing SAT: Assign values to  $n$  variables, and each clause has 3 ways in which it can be satisfied.
- Construct graph with  $2^n$  Hamiltonian cycles, where each cycle corresponds to some boolean assignment.
- Then add more graph structure to encode constraints on assignments imposed by the clauses.

# The Reduction: Phase I

- Traverse path  $i$  from left to right iff  $x_i$  is set to true
- Each path has  $3(m + 1)$  nodes where  $m$  is number of clauses in  $\varphi$ ; nodes numbered from left to right ( $1$  to  $3m + 3$ )

# The Reduction: Phase II

- Add vertex  $c_j$  for clause  $C_j$ .  $c_j$  has edge *from* vertex  $3j$  and *to* vertex  $3j + 1$  on path  $i$  if  $x_i$  appears in clause  $C_j$ , and has edge *from* vertex  $3j + 1$  and *to* vertex  $3j$  if  $\neg x_i$  appears in  $C_j$ .

# Correctness Proof

## Proposition

$\varphi$  has a satisfying assignment iff  $G_\varphi$  has a Hamiltonian cycle.

## Proof.

$\Rightarrow$  Let  $a$  be the satisfying assignment for  $\varphi$ . Define Hamiltonian cycle as follows

- If  $a(x_i) = 1$  then traverse path  $i$  from left to right
- If  $a(x_i) = 0$  then traverse path  $i$  from right to left
- For each clause, path of at least one variable is in the “right” direction to splice in the node corresponding to clause □

# Hamiltonian Cycle $\Rightarrow$ Satisfying assignment

Suppose  $\Pi$  is a Hamiltonian cycle in  $G_\varphi$

- If  $\Pi$  enters  $c_j$  (vertex for clause  $C_j$ ) from vertex  $3j$  on path  $i$  then it must leave the clause vertex on edge to  $3j + 1$  on the *same path  $i$* 
  - If not, then only unvisited neighbor of  $3j + 1$  on path  $i$  is  $3j + 2$
  - Thus, we don't have two unvisited neighbors (one to enter from, and the other to leave) to have a Hamiltonian Cycle
- Similarly, if  $\Pi$  enters  $c_j$  from vertex  $3j + 1$  on path  $i$  then it must leave the clause vertex  $c_j$  on edge to  $3j$  on path  $i$

# Example

# Hamiltonian Cycle $\implies$ Satisfying assignment (contd)

- Thus, vertices visited immediately before and after  $C_j$  are connected by an edge
- We can remove  $C_j$  from cycle, and get Hamiltonian cycle in  $G - C_j$
- Consider Hamiltonian cycle in  $G - \{C_1, \dots, C_m\}$ ; it traverses each path in only one direction, which determines the truth assignment

# Graph Coloring

**Observation:** If  $G$  is colored with  $k$  colors then each color class (nodes of same color) form an independent set in  $G$ . Thus,  $G$  can be partitioned into  $k$  independent sets iff  $G$  is  $k$ -colorable.

# Graph Coloring and Register Allocation

## Register Allocation

Assign variables to (at most)  $k$  registers such that variables needed at the same time are not assigned to the same register

## Interference Graph

Vertices are variables, and there is an edge between two vertices, if the two variables are “live” at the same time.

## Observations

- [Chaitin] Register allocation problem is equivalent to coloring the interference graph with  $k$  colors
- Moreover,  $3\text{-COLOR} \leq_P k\text{-Register Allocation}$ , for any  $k \geq 3$

- Breakup a frequency range  $[a, b]$  into disjoint *bands* of frequencies  $[a_0, b_0], [a_1, b_1], \dots, [a_k, b_k]$
- Each cell phone tower (simplifying) gets one band
- Constraint: nearby towers cannot be assigned same band, otherwise signals will interference

# Converting a circuit into a CNF formula

Take the conjunction of all the CNF sub-formulas

$$\begin{aligned} & x_k \wedge (\neg x_k \vee x_i) \wedge (\neg x_k \vee x_j) \\ & \wedge (x_k \vee \neg x_i \vee \neg x_j) \wedge (\neg x_j \vee x_g) \\ & \wedge (\neg x_j \vee x_h) \wedge (x_j \vee \neg x_g \vee \neg x_h) \\ & \wedge (x_i \vee x_f) \wedge (\neg x_i \vee \neg x_f) \\ & \wedge (x_h \vee \neg x_d) \wedge (x_h \vee \neg x_e) \\ & \wedge (\neg x_h \vee x_d \vee x_e) \wedge (x_g \vee \neg x_b) \\ & \wedge (x_g \vee \neg x_c) \wedge (\neg x_g \vee x_b \vee x_c) \\ & \wedge (\neg x_f \vee x_a) \wedge (\neg x_f \vee x_b) \\ & \wedge (x_f \vee \neg x_a \vee \neg x_b) \wedge (\neg x_d) \wedge x_a \end{aligned}$$

We got a **CNF** formula that is satisfiable if and only if the original circuit is satisfiable.

- 1 For each gate (vertex)  $v$  in the circuit, create a variable  $x_v$
- 2 **Case**  $\neg$ :  $v$  is labeled  $\neg$  and has one incoming edge from  $u$  (so  $x_v = \neg x_u$ ). In **SAT** formula generate, add clauses  $(x_u \vee x_v)$ ,  $(\neg x_u \vee \neg x_v)$ . Observe that

$$x_v = \neg x_u \text{ is true} \iff \begin{array}{l} (x_u \vee x_v) \\ (\neg x_u \vee \neg x_v) \end{array} \text{ both true.}$$

- 1 If  $v$  is an input gate with a fixed value then we do the following.  
If  $x_v = 1$  add clause  $x_v$ . If  $x_v = 0$  add clause  $\neg x_v$
- 2 Add the clause  $x_v$  where  $v$  is the variable for the output gate

# Correctness of Reduction

Need to show circuit  $C$  is satisfiable iff  $\varphi_C$  is satisfiable

$\Rightarrow$  Consider a satisfying assignment  $a$  for  $C$

- 1 Find values of all gates in  $C$  under  $a$
- 2 Give value of gate  $v$  to variable  $x_v$ ; call this assignment  $a'$
- 3  $a'$  satisfies  $\varphi_C$  (exercise)

$\Leftarrow$  Consider a satisfying assignment  $a$  for  $\varphi_C$

- 1 Let  $a'$  be the restriction of  $a$  to only the input variables
- 2 Value of gate  $v$  under  $a'$  is the same as value of  $x_v$  in  $a$
- 3 Thus,  $a'$  satisfies  $C$
