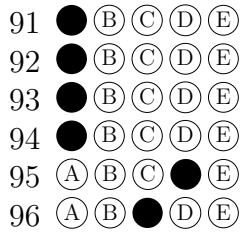
- ***Don't panic!***
- If you brought anything except your writing implements, your double-sided **handwritten** (in the original) 8½" × 11" cheat sheet, and your university ID, please put it away for the duration of the exam. In particular, please turn off and put away *all* medically unnecessary electronic devices.
  - Submit your cheat sheet together with your exam. An exam without your cheat sheet attached to it will not be graded.
  - If you are NOT using a cheat sheet, please indicate so in large friendly letters on this page.
- **Best answer.** Choose best possible choice if multiple options seems correct to you – for algorithms, faster is always better.
- Please ask for clarification if any question is unclear.
- **This exam lasts 170 minutes.**
- Fill your answers in the Scantron form using a pencil. We also recommend you circle/mark your answer in the exam booklet.
- Please return ***all*** paper with your answer booklet: your cheat sheet, and all scratch paper. We will **not** return the cheat sheet.
- Do not fill more than one answer on the Scantron form - such answers would not be graded. Also, fill your answer once you are sure of your answer – erasing an answer might make the form unscannable.
- ***Good luck!***

Before doing the exam...

- Fill your name and netid in the back of the Scantron form, and also on the top of this page.
- **Fill in the pattern shown on the right in the Scantron form.**

  This encodes which version of the exam you are taking, so that we can grade it.



1

1. (3 points) You are given a directed graph G with n vertices, m edges, and positive weights on the vertices (but not on the edges). In addition, you are given two vertices u and v, and a number t. The *weight* of a path π is the total weight of the vertices of π. Consider the problem of computing a (simple) path σ connecting a vertex u to a vertex v, such that the weight of σ is at least t. This problem is

(A) Solvable in $O(n+m)$ time.
(B) Undecidable.
(C) NP-Hard.
(D) Solvable in $O(n \log n + m)$ time.
(E) Polynomially equivalent to Eulerian cycle.

---

2. (3 points) You are given two algorithms B_Y and B_N. Both algorithms read an undirected graph G and a number k. If G has a vertex cover of size $\leq k$, then B_Y would stop (in polynomial time!) and output YES (if there is no such vertex cover then B_Y might run forever). Similarly, if G does not have a vertex cover of size $\leq k$, then the algorithm B_N would stop in polynomial time, and output NO (if there is such a vertex cover then B_N might run forever).
In such a scenario:

(A) This would imply that $P = NP$.
(B) Impossible since $P \neq NP$.
(C) One can in polynomial time output if G has a an vertex cover of size $\leq k$ or not.
(D) At least two of the other answers are correct.
(E) This would imply that $P \neq NP$.

---

3. (3 points) Consider the recurrence $f(n) = f\Big(\lfloor n/3)\rfloor\Big) + f\Big(\lfloor (n/2)\rfloor\Big) + O(n)$, where $f(n) = O(1)$ if $n < 10$. The solution to this recurrence is

(A) $O(n)$.
(B) $O(n^2)$.
(C) None of the above.
(D) $O(1)$.
(E) $O(n \log n)$.

4. (3 points) Given a DFA N and an NFA M with n and m states, respectively. Then there is a DFA M' that accepts the language $L(N) \setminus L(M)$.

(A) True, and the number of states of M is at most $n2^m$.
(B) True, and the number of states of M is at most nm.
(C) True, and the number of states of M is at most $2^n 2^m$, and no other answer applies.
(D) False.
(E) True, and the number of states of M is at most $(m+n)2^{(m+n)/2}$.

---

5. (3 points) The number of decidable languages is

(A) countable.
(B) uncountable.
(C) undecidable.
(D) $2^{\mathbb{R}} = \aleph_2$.
(E) None of the other answers are correct.

---

6. (3 points) For the following recurrence (evaluated from top to bottom in this order):

$$g(i,j) = \begin{cases} 1 & i < 0 \text{ or } j < 0 \\ g(\lfloor i/2 \rfloor, j) + 1 & i > j \\ g(i-1,j) + g(i-2,j-1) + g(i-3,j-2) & \text{otherwise.} \end{cases}$$

Assume that every arithmetic operation takes constant time (even if the numbers involved are large). Computing $g(n,n)$ can be done in (faster is better):

(A) $O(n)$ time, by recursion.
(B) $O(n^3)$ time, using dynamic programming.
(C) $O(2^n)$.
(D) $O(n \log n)$ time.
(E) $O(n^2)$ time, using dynamic programming.

---

7. (2 points) Consider the language $L = \{1^i \mid i \text{ is prime}\}$. This language is

(A) Regular.
(B) Undecidable.
(C) Decidable.
(D) Context-free.
(E) Finite.

8. (3 points) Let $L_1, L_2 \subseteq \Sigma^*$ be context-free languages. Then the language $L_1 \cap L_2$ is always context-free.

(A) None of the other answers.
(B) False if the languages L_1 and L_2 are decidable, , and no other answer is correct.
(C) True only if the languages L_1 and L_2 are decidable, and no other answer is correct.
(D) True.
(E) False.

---

9. (3 points) For the language $L = \{0^n 1^n \mid n \geq 0\}$, we have

(A) $F = \left\{0^i 1^j \;\middle|\; i < j\right\}$ is a fooling set for L.
(B) All of the sets suggested are fooling sets.
(C) $F = \left\{0^i 1^i \;\middle|\; i \geq 0\right\}$ is a fooling set for L.
(D) $F = \left\{0^i \;\middle|\; i \geq 0\right\}$ is a fooling set for L.
(E) None of the sets suggested are fooling sets.

---

10. (2 points) You are given an unsorted set Z of n numbers. Deciding if there are two numbers x and y in Z such that $x = 1 - y$ can be solved in (faster is better):

(A) $O(n)$ time.
(B) $O(n \log n)$ time.
(C) $O(n^2 \log n)$ time.
(D) $O(n^2)$ time.
(E) $O(n^{3/2})$ time.

---

11. (3 points) Given an undirected graph G with n vertices and m edges, and a number k, deciding if G has a spanning tree with maximum degree k is

(A) Can be done in polynomial time.
(B) Can be done in $O((n+m)\log n)$ time, and there is no faster algorithm.
(C) Can be done in $O(n \log n + m)$ time, and there is no faster algorithm.
(D) NP-Complete.
(E) Can be done in $O(n+m)$ time.

12. (3 points) Let $P_1, \ldots, P_{k+1}$ be $k+1$ decision problems in NP. Consider a sequence of k polynomial reductions $R_1, \ldots, R_k$, where R_i works in quadratic time in its input size, and is a reduction from P_i to P_{i+1}. As such, we have that

(A) If P_{k+1} is NP-Complete then P_1 is NP-Complete (assuming k is a constant).
(B) $P_1, P_2, \ldots, P_k$ are polynomial time solvable.
(C) $P_1, P_2, \ldots, P_k$ are NP-Complete.
(D) None of the other answers makes any sense. Also, this exam is stupid.
(E) If P_1 is NP-Complete then P_{k+1} is NP-Complete (assuming k is a constant).

---

13. (2 points) You are given a set $\mathcal{I} = \{I_1, I_2, \ldots, I_n\}$ of n weighted intervals on the real line. Consider the problem of computing a value $x \in \mathbb{R}$, that maximizes the total weight of the intervals of $\mathcal{I}$ containing x. This problem:

(A) Can be done in polynomial time.
(B) Undecidable.
(C) NP-Complete.
(D) Can be done in linear time.
(E) NP-Hard.

---

14. (3 points) You are given a graph G with n vertices and m edges, and with weights on the edges. In addition, you are given the MST tree T.
Next, you are informed that the price of some edge e in the graph G had decreased from its current cost, to a new cost α. Deciding if T is still the MST of the graph with the updated weights can be done in (faster is better):

(A) $O(n \log n + m)$ time.
(B) $O(nm)$ time algorithm, and no faster algorithm is possible.
(C) $O(n)$ time.
(D) None of the other answers.
(E) $O(\log n)$ time, after preprocessing the graph in $O(n)$ time.

---

15. (2 points) Consider the following decision problem: Given a directed graph G, and two vertices u, v in G, is there a path from u to v in G?
This problem has a polynomial length certificate and polynomial time certifier. This claim is

(A) False.
(B) True.

16. (3 points) Consider the problem of checking if a graph has k vertices that are all adjacent to each other. This problem can be solved in

(A) It is NP-Complete, so it can not be solved efficiently.
(B) Polynomial time.
(C) None of the other answers are correct.
(D) Maybe polynomial time – we do not know. Currently fastest algorithm known takes exponential time.

---

17. (3 points) Given a graph G, and vertices u and v, these two vertices are ***robustly connected***, if they remain connected, even if we remove any three vertices in G (except for u and v, naturally). Consider the problem of deciding if u and v are robustly connected.

(A) This problem can be solved in polynomial time.
(B) This problem is NP-Hard.

---

18. (3 points) Let G be a directed graph with weights on the edges (the weights can be positive or negative). The graph G has n vertices and m edges. Computing the shortest **simple** path between two vertices in G can be done in:

(A) This can be solved in $O(n \log n + m)$ time using Dijkstra.
(B) This is not defined if there are negative cycles in the graph. As such, it can not be computed.
(C) This is NP-Hard.
(D) None of the above.
(E) This can be solved in $O(nm)$ time using Bellman-Ford.

---

19. (3 points) You are given a DFA D with n states, and with the input alphabet being $\Sigma = \{0, 1\}$. Given a binary string $w \in \Sigma^*$ of length m, one can simulate D on a regular computer and decide if D accepts w. Which of the following is correct?

(A) None of the other answers is correct.
(B) This can be done in $O(n^m)$ time, and no faster algorithm is possible.
(C) This problem can not be done in polynomial time, because it is undecidable.
(D) This can be done in $O(2^n m)$ time, and no faster algorithm is possible.
(E) This can done in $O(n + m)$ time.

---

20. (1 point) All problems in P are solvable in exponential time. This statement is

(A) True.
(B) False.

21. (2 points) Consider a DFA M with m states defined over $\{0,1\}^*$. There is an equivalent regular expression r (i.e., $L(r) = L(N)$), such that (tighter is better):

(A) r is of length at most $f(m)$, where f is some function that is not specified in the other answers.
(B) r is of length at most $O(m \log m)$.
(C) none of other answers.
(D) r is of length at most $O(m)$.

---

22. (3 points) Given an undirected graph G, with n vertices and m edges, consider the decision problem of determining if the vertices of G can be colored (legally) by n colors (i.e., no adjacent pair of vertices have the same color). This problem is:

(A) Can be solved in polynomial time.
(B) NP-Complete.
(C) Undecidable.
(D) Solvable in $O(1)$ time.
(E) Solvable in $O(n + m)$ time.

---

23. (3 points) If a problem is NP-Hard, then it can also be undecidable. This statement is

(A) True if $P = NP$.
(B) True.
(C) False if $P = NP$.
(D) None of the other answers.
(E) False.

---

24. (3 points) Given an array $B[1 \ldots n]$ with n real numbers (B is not sorted), consider the problem computing and printing out the smallest $\lfloor \log^3 n \rfloor$ numbers in B that are larger than the median number in B – the numbers should be output in sorted order. This can be done in

(A) $O(\log^4 n)$ time, and no faster algorithm is possible.
(B) $O(n \log n)$ time, and no faster algorithm is possible.
(C) $O(n)$ time, and no faster algorithm is possible.
(D) $O(\log^3 n)$ time, and no faster algorithm is possible.

25. (3 points) Let B be the problem of deciding if the shortest path in a graph between two given vertices is smaller than some parameter k (where the weights on the edges of the graph are positive).
Let C be the problem of deciding if a given instance of 2SAT formula is satisfiable. Pick the correct answer out of the following:

(A) None of the other answers is correct.
(B) There is no relation between the two problems, and no reduction is possible.
(C) There is a polynomial time reduction from C to B, but only if $P \neq NP$..
(D) There is a polynomial time reduction from B to C.
(E) There is a polynomial time reduction from B to C, but only if $P = NP$.

---

26. (2 points) You are given an undirected graph G with n vertices and m edges, and a pair of vertices u, v. Deciding if u and v are in the same connected component of G can be done in

(A) $O(n \log n + m)$ time.
(B) $O(nm)$ time using Bellman-Ford.
(C) $O(n + m)$ time.
(D) None of the other answers is correct.
(E) only exponential time since this problem is NP-Complete.

---

27. (3 points) For a text file T, let $\langle T \rangle$ denote the string that is the content of T. Consider the language

$$L = \{\langle T \rangle \mid T \text{ is a java program that stops on some input}\}.$$

This language is

(A) Undecidable.
(B) Regular.
(C) Decidable.
(D) Context-free.
(E) None of the other answers.

---

28. (3 points) Given k sorted lists $L_1, L_2, \ldots, L_k$ with a total of n elements, one can compute the sorted list of all the elements in these lists in (faster is better):

(A) $O(n \log n)$ time.
(B) $O(n)$ time.
(C) $O(nk)$ time.
(D) $O(n^2)$ time.
(E) $O(n \log k)$ time.

29. (3 points) Let $\mathcal{NPL}$ be the class of all decision problems, for which there is a polynomial time certifier that works in polynomial time, and furthermore, for an input of length n, if it is a YES instance, then there is a certificate that is a binary string of length $O(\log n)$. We have that:

(A) $\mathcal{NPL}$ is an empty class of problems.
(B) NP $\subseteq \mathcal{NPL}$.
(C) None of the other answers is correct.
(D) All the problems in $\mathcal{NPL}$ can be solved in polynomial time.
(E) $\mathcal{NPL}$ contains some NP-Complete problems.

---

30. (2 points) For a word $w = w_1 w_2 \ldots w_m$, with $w_i \in \{0, 1\}^*$, let $w^Z = \overline{w_1} \ldots \overline{w_m}$, where $\overline{0} = 1$ and $\overline{1} = 0$. If a language L is a regular language, then the language $L^Z = \left\{ w^Z \;\middle|\; w \in L \right\}$ is regular.

(A) False
(B) True

---

31. (2 points) Consider a Turing machine (i.e., program) M that accepts an input $w \in \Sigma^*$ if and only if there is a CFG G such that $w \in L(G)$. Then the language of $L(M)$ is

(A) context-free.
(B) Σ^*.
(C) finite.
(D) undecidable.
(E) not well defined.

---

32. (3 points) You are given a directed graph G with n vertices and m edges. Consider the problem of deciding if this graph has a vertex s, from which you can reach all the vertices of G. Solving this problem is

(A) NP-Hard by a reduction from Hamiltonian path/cycle.
(B) Doable in $O(n + m)$ time.
(C) NP-Hard by a reduction from 3SAT.
(D) Doable in $O(n(n + m))$ time, and no faster algorithm exists.
(E) NP-Hard by a reduction to Hamiltonian path/cycle.

33. (5 points) A binary string $s \in \{0,1\}^*$ is ***k-balanced*** if $|\#(0,s) - \#(1,s)| \leq k$, where k is a prespecified parameter. For a string $w \in \{0,1\}^*$ and parameters k and h, a split $u_1, u_2, \ldots, u_\ell$ is a ***(k,h)-valid split*** of w iff:

(I) For all i, $u_i \in \{0,1\}^*$.
(II) For all i, u_i is k-balanced.
(III) $w = u_1 u_2 \ldots u_\ell$ (i.e., w is the concatenation of $u_1, u_2, \ldots, u_\ell$),
(IV) $\ell \leq h$.

Given as input a string $w \in \{0,1\}^*$ of length m, and parameters k and h, an algorithm can decide if there is a (k,h)-valid split of w in (faster is better):

(A) $O(m^2 k)$ time.
(B) $O(m^4)$.
(C) $O(m^2 h)$ time.
(D) $O(m^3 k)$ time.
(E) $O(m^3 h)$ time.

---

34. (3 points) Given a directed graph G with n vertices and m edges, consider the problem of deciding if there is a simple path that visits at least half of the vertices of G.

(A) Can be solved in $O(n+m)$ time.
(B) NP-Complete.
(C) NP-Hard.
(D) Can be solved in $O(nm)$ time, and no faster algorithm is possible.
(E) At least two of the other answers are correct.

---

35. (3 points) Consider a CNF formula F with m clauses and n variables. The problem of computing an assignment that satisfies as many clauses as possible, is

(A) None of the other answers are correct.
(B) Can be solved in linear time.
(C) Can not be solved in linear time, but can be done in polynomial time.
(D) NP-Hard.

36. (3 points) Give a CNF formula F with n variables, and m clauses, where every clause has exactly three literals (reminder: a literal is either a variable or its negation). Then, one can compute a satisfying assignment to F in:

(A) $O(2^n - 2^m)$ time.
(B) $O(n + m)$ time.
(C) This is Satisfiability and it can not be solved in polynomial time unless $P = NP$.
(D) $O(n \log n + m)$ time.
(E) $O(n^2 + m^2)$ time.
