Give context-free grammars for each of the following languages.

Solution:  $S \to \varepsilon \mid 00S1$ .

 $2 \quad \{0^m 1^n \mid m \neq 2n\}$ 

(**Hint:** If  $m \neq 2n$ , then either m < 2n or m > 2n.)

### **Solution:**

To simplify notation, let  $\Delta(w) = \#(0, w) - 2\#(1, w)$ . Our solution follows the following logic. Let w be an arbitrary string in this language.

- Because  $\Delta(w) \neq 0$ , then either  $\Delta(w) > 0$  or  $\Delta(w) < 0$ .
- If  $\Delta(w) > 0$ , then  $w = 0^i z$  for some integer i > 0 and some suffix z with  $\Delta(z) = 0$ .
- If  $\Delta(w) < 0$ , then  $w = x1^j$  for some integer j > 0 and some prefix x with either  $\Delta(x) = 0$  or  $\Delta(x) = 1$ .
- Substrings with  $\Delta = 0$  is generated by the previous grammar; we need only a small tweak to generate substrings with  $\Delta = 1$ .

Here is one way to encode this case analysis as a CFG. The nonterminals M and L generate all strings where the number of 0s is M ore or L ess than twice the number of 1s, respectively. The last nonterminal generates strings with  $\Delta = 0$  or  $\Delta = 1$ .

$$S \to M \mid L$$
 
$$\{0^{m}1^{n} \mid m \neq 2n\}$$
 
$$M \to 0M \mid 0E$$
 
$$\{0^{m}1^{n} \mid m > 2n\}$$
 
$$L \to L1 \mid E1$$
 
$$\{0^{m}1^{n} \mid m < 2n\}$$
 
$$E \to \varepsilon \mid 0 \mid 00E1$$
 
$$\{0^{m}1^{n} \mid m = 2n \text{ or } 2n + 1\}$$

Here is a different correct solution using the same logic. We either identify a non-empty prefix of 0s or a non-empty prefix of 1s, so that the rest of the string is as "balanced" as possible. We also generate strings with  $\Delta = 1$  using a separate non-terminal.

$$S \to AE \mid EB \mid FB$$
  $\{0^{m}1^{n} \mid m \neq 2n\}$   
 $A \to 0 \mid 0A$   $0^{+} = \{0^{i} \mid i \geq 1\}$   
 $B \to 1 \mid 1B$   $1^{+} = \{1^{j} \mid j \geq 1\}$   
 $E \to \varepsilon \mid 00E1$   $\{0^{m}1^{n} \mid m = 2n\}$   
 $F \to 0E$   $\{0^{m}1^{n} \mid m = 2n + 1\}$ 

Alternatively, we can separately generate all strings of the form  $0^{\text{odd}}1^*$ , so that we don't have to worry about the case  $\Delta = 1$  separately.

$$S \to D \mid M \mid L \qquad \qquad \{0^{m}1^{n} \mid m \neq 2n\}$$

$$D \to 0 \mid 00D \mid D1 \qquad \qquad \{0^{m}1^{n} \mid m \text{ is odd}\}$$

$$M \to 0M \mid 0E \qquad \qquad \{0^{m}1^{n} \mid m > 2n\}$$

$$L \to L1 \mid E1 \qquad \qquad \{0^{m}1^{n} \mid m < 2n \text{ and } m \text{ is even}\}$$

$$E \to \varepsilon \mid 00E1 \qquad \qquad \{0^{m}1^{n} \mid m = 2n\}$$

# **Solution:**

Intuitively, we can parse any string  $w \in L$  as follows. First, remove the first 2k 0s and the last k 1s, for the largest possible value of k. The remaining string cannot be empty, and it must consist entirely of 0s, entirely of 1s, or a single 0 followed by 1s.

$$S \to 00S1 \mid A \mid B \mid C$$
  $\{0^{m}1^{n} \mid m \neq 2n\}$   
 $A \to 0 \mid 0A$   $0^{+}$   
 $B \to 1 \mid 1B$   $1^{+}$   
 $C \to 0 \mid 0B$   $01^{+}$ 

Lets elaborate on the above, since k is maximal,  $w = 0^{2k}w'1^k$ . If w' starts with 00, and ends with a 1, then we can increase k by one. As such, w' is either in  $0^+$  or  $1^+$ . If w' contains both 0s and 1s, then it can contain only a single 0, followed potentially by  $1^+$ . We conclude that  $w' \in 0^+ + 1^+ + 01^+$ .

$$3 \quad \{0,1\}^* \setminus \{0^{2n}1^n \mid n \ge 0\}$$

## Solution:

This language is the union of the previous language and the complement of  $0^*1^*$ , which is  $(0+1)^*10(0+1)^*$ .

$$S \to T \mid X \qquad \{0,1\}^* \setminus \{0^{2n}1^n \mid n \ge 0\}$$

$$T \to 00T1 \mid A \mid B \mid C \qquad \{0^m1^n \mid m \ne 2n\}$$

$$A \to 0 \mid 0A \qquad 0^+$$

$$B \to 1 \mid 1B \qquad 1^+$$

$$C \to 0 \mid 0B \qquad 01^+$$

$$X \to Z10Z \qquad (0+1)^*10(0+1)^*$$

$$Z \to \varepsilon \mid 0Z \mid 1Z \qquad (0+1)^*$$

#### Work on these later:

 $\{w \in \{0,1\}^* \mid \#(0,w) = 2 \cdot \#(1,w)\}$  – Binary strings where the number of 0s is exactly twice the number of 1s.

# **Solution:**

$$S \rightarrow \varepsilon \mid SS \mid 00S1 \mid 0S1S0 \mid 1S00.$$

Here is a sketch of a correctness proof; a more detailed proof appears in the homework.

For any string w, let  $\Delta(w) = \#(0, w) - 2 \cdot \#(1, w)$ . Suppose w is a binary string such that  $\Delta(w) = 0$ . Suppose w is nonempty and has no non-empty proper prefix x such that  $\Delta(x) = 0$ . There are three possibilities to consider:

• Suppose  $\Delta(x) > 0$  for every proper prefix x of w. In this case, w must start with 00 and end with 1. Thus, w = 00x1 for some string  $x \in L$ .

- Suppose  $\Delta(x) < 0$  for every proper prefix x of w. In this case, w must start with 1 and end with 00. Let x be the shortest non-empty prefix with  $\Delta(x) = 1$ . Thus, w = 1X00 for some string  $x \in L$ .
- Finally, suppose  $\Delta(x) > 0$  for some prefix x and  $\Delta(x') < 0$  for some longer proper prefix x'. Let x' be the shortest non-empty proper prefix of w with  $\Delta < 0$ . Then x' = 0y1 for some substring y with  $\Delta(y) = 0$ , and thus w = 0y1z0 for some strings  $y, z \in L$ .

## **Solution:**

All strings of odd length are in L.

Let w be any even-length string in L, and let m = |w|/2. For some index  $i \le m$ , we have  $w_i \ne w_{m+i}$ . Thus, w can be written as either x1y0z or x0y1z for some substrings x, y, z such that |x| = i - 1, |y| = m - 1, and |z| = m - i. We can further decompose y into a prefix of length i - 1 and a suffix of length m - i. So we can write any even-length string  $w \in L$  as either x1x'z'0z or x0x'z'1z, for some strings x, x', z, z' with |x| = |x'| = i - 1 and |z| = |z'| = m - i. Said more simply, we can divide w into two odd-length strings, one with a 0 at its center, and the other with a 1 at its center.

$S \to AB \mid BA \mid A \mid B$	strings not of the form $ww$
$A  o 0 \mid \Sigma A \Sigma$	odd-length strings with $0$ at center
$B  ightarrow 1 \mid \Sigma B \Sigma$	odd-length strings with ${\bf 1}$ at center
$\Sigma \to 0 \mid 1$	single character
