

CS 414 – Multimedia Systems Design

Lecture 19 –

Multimedia Session Protocols

(Layer 5)

Klara Nahrstedt

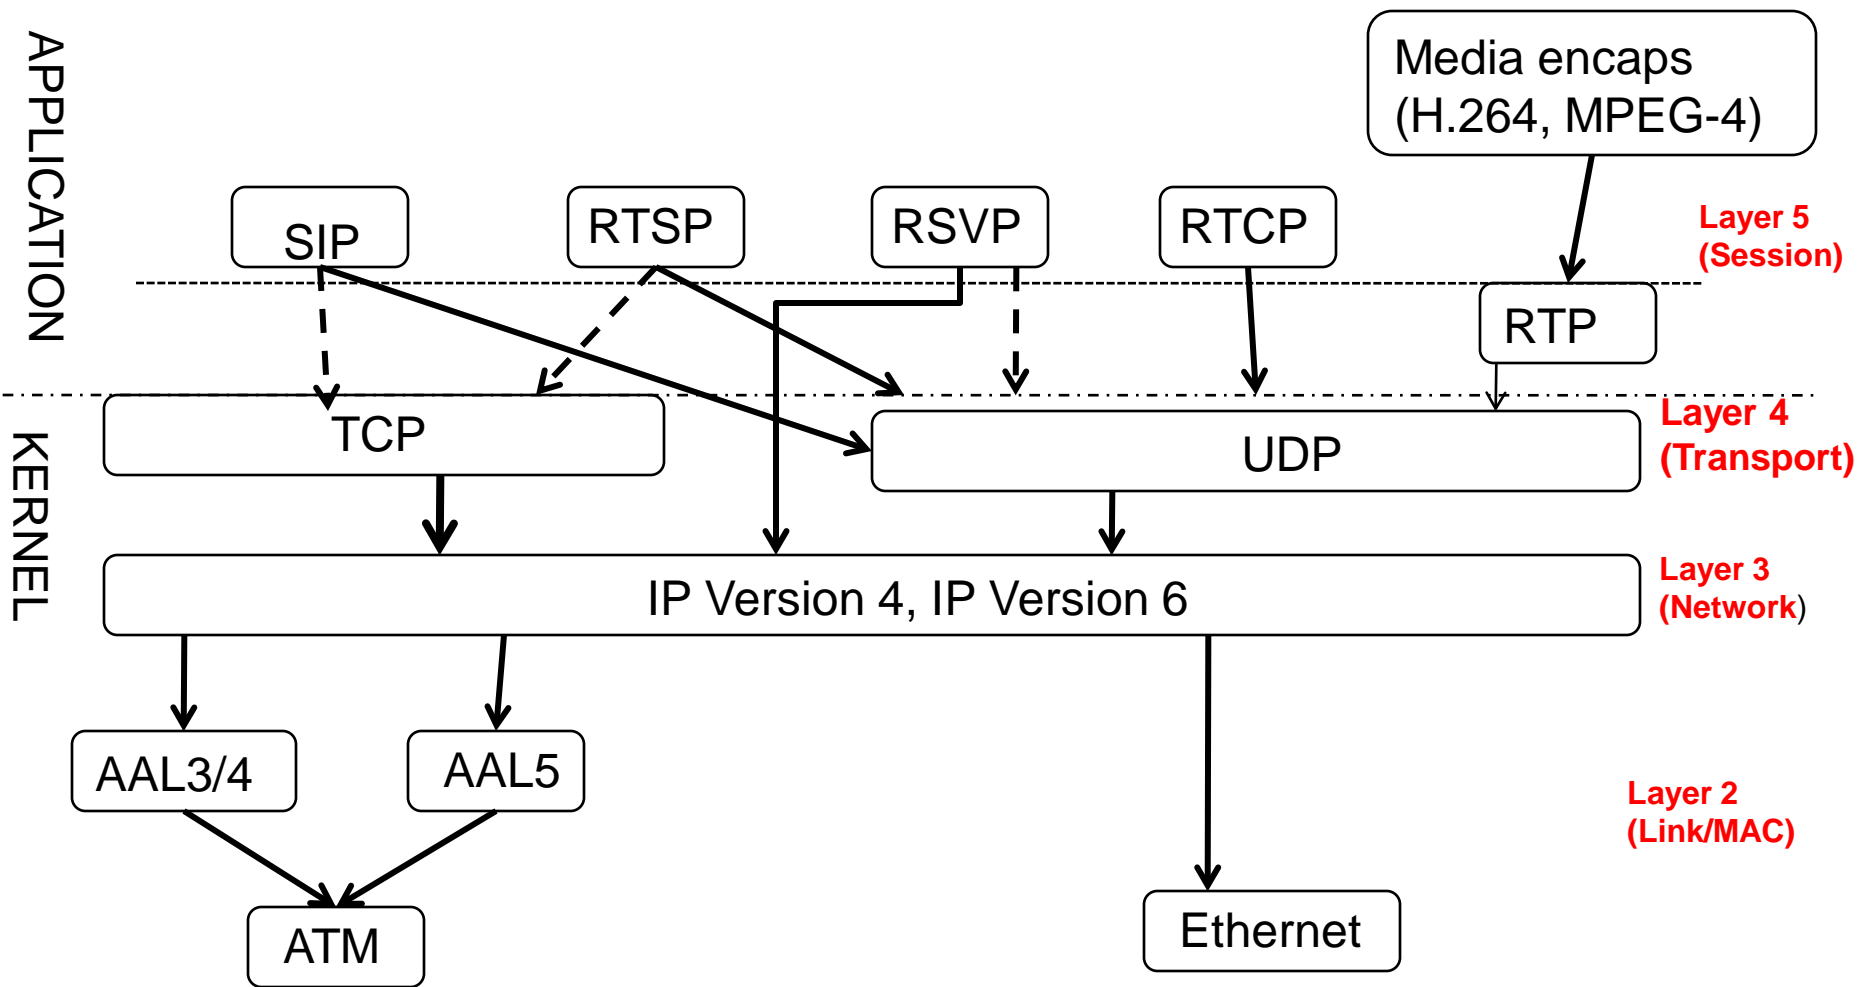

Spring 2009

Administrative

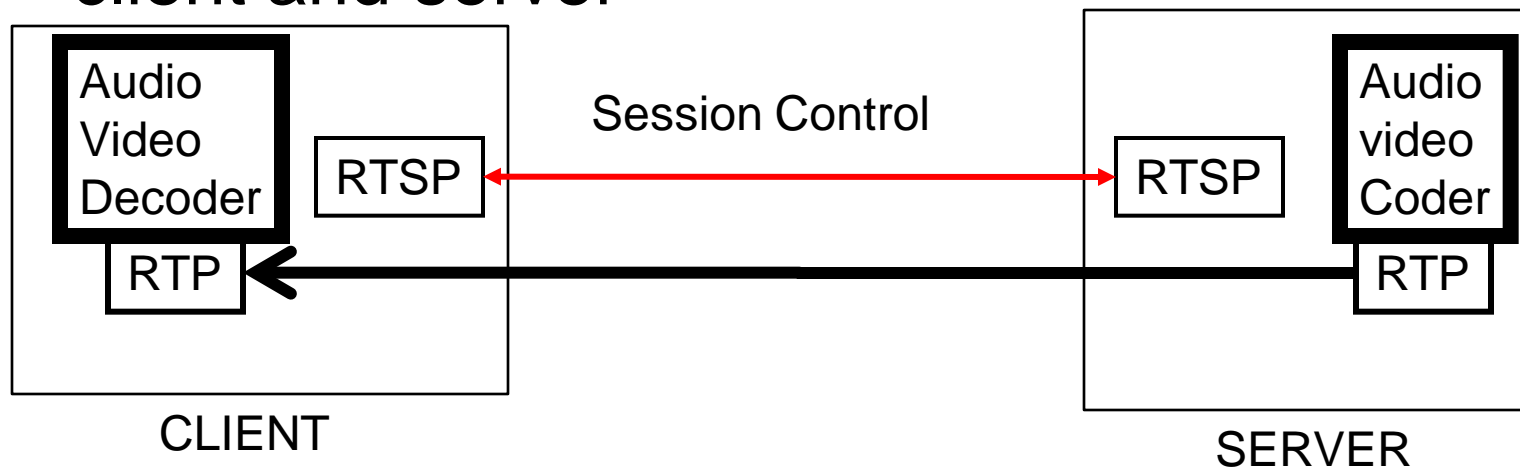

- HW1 deadline, Friday, March 6
- Midterm, March 9

Internet Multimedia Protocol Stack

Real-Time Streaming Protocol (RTSP)

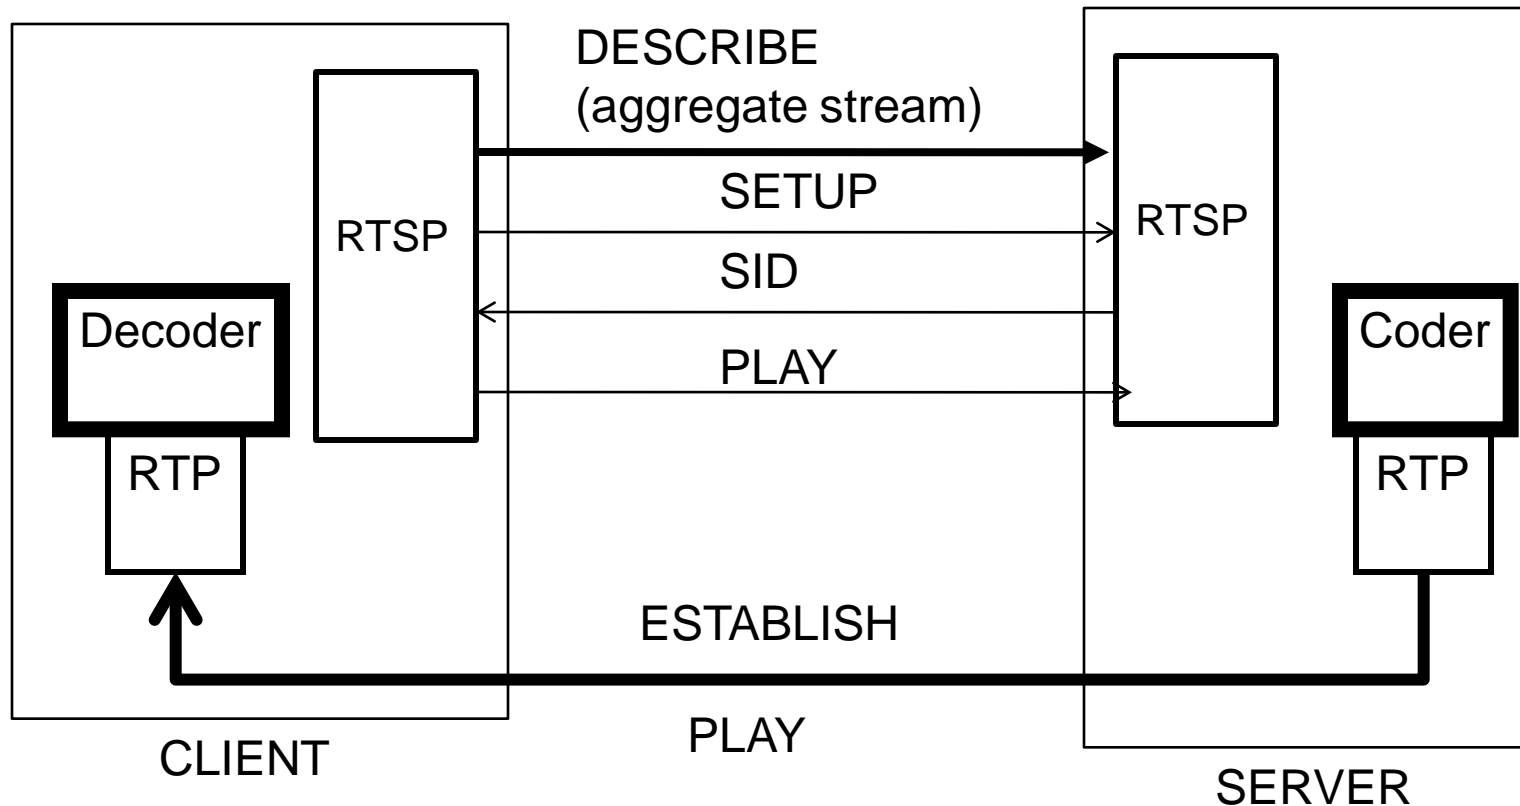

- Application Protocol for Control of multimedia streams – allows for “Internet VCR”
- This is **not** an application data transmission protocol, just **remote control protocol** between client and server

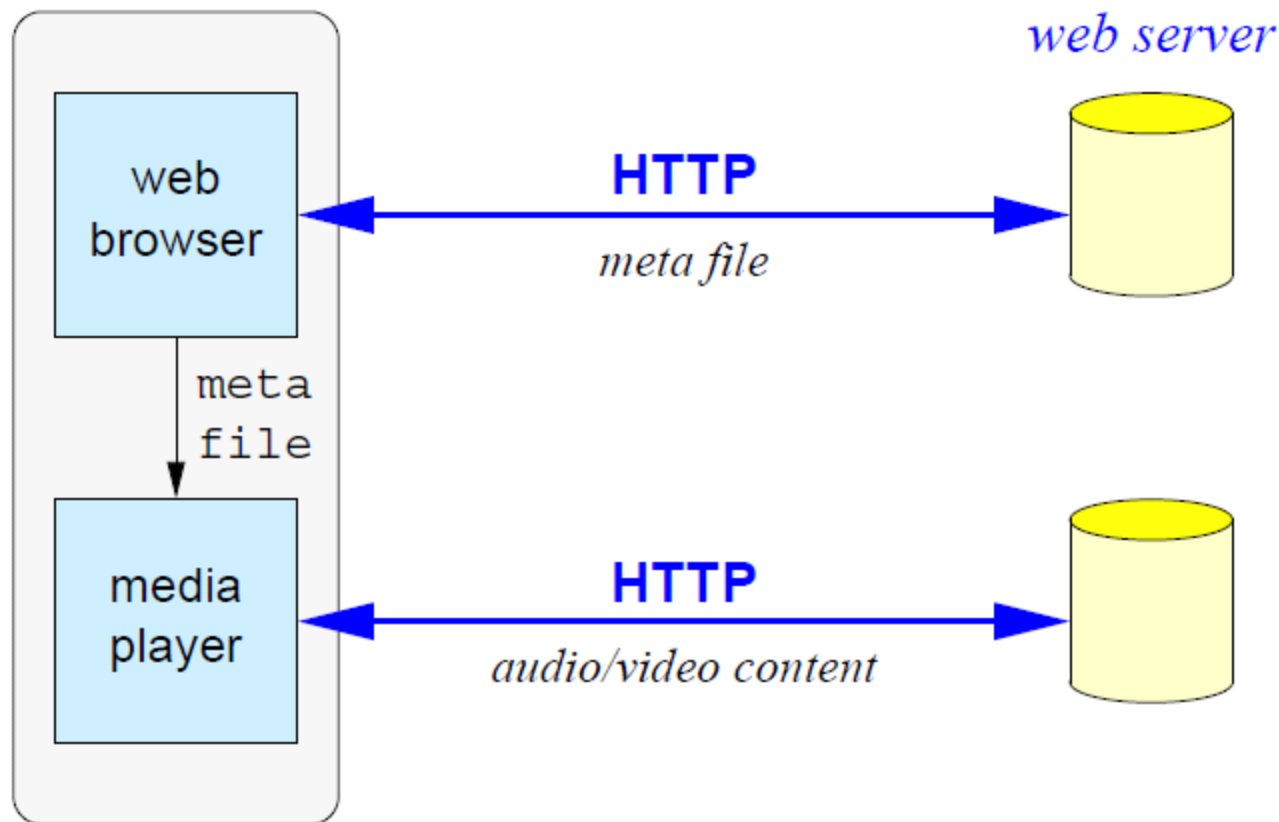

RTSP Methods

Request	Direction	Description
OPTIONS	S <-> C	Determine capabilities of server (S) or client (C)
DESCRIBE	C -> S	Get description of media stream
ANNOUNCE	S <-> C	Announce new session description
SETUP	C -> S	Create media session
RECORD	C -> S	Start media recording
PLAY	C -> S	Start media delivery
PAUSE	C -> S	Pause media delivery
REDIRECT	S -> C	Use other server
TEARDOWN	C -> S	Destroy media session
SET_PARAMETER	S <-> C	Set server or client parameter
GET_PARAMETER	S <-> C	Read server or client parameter

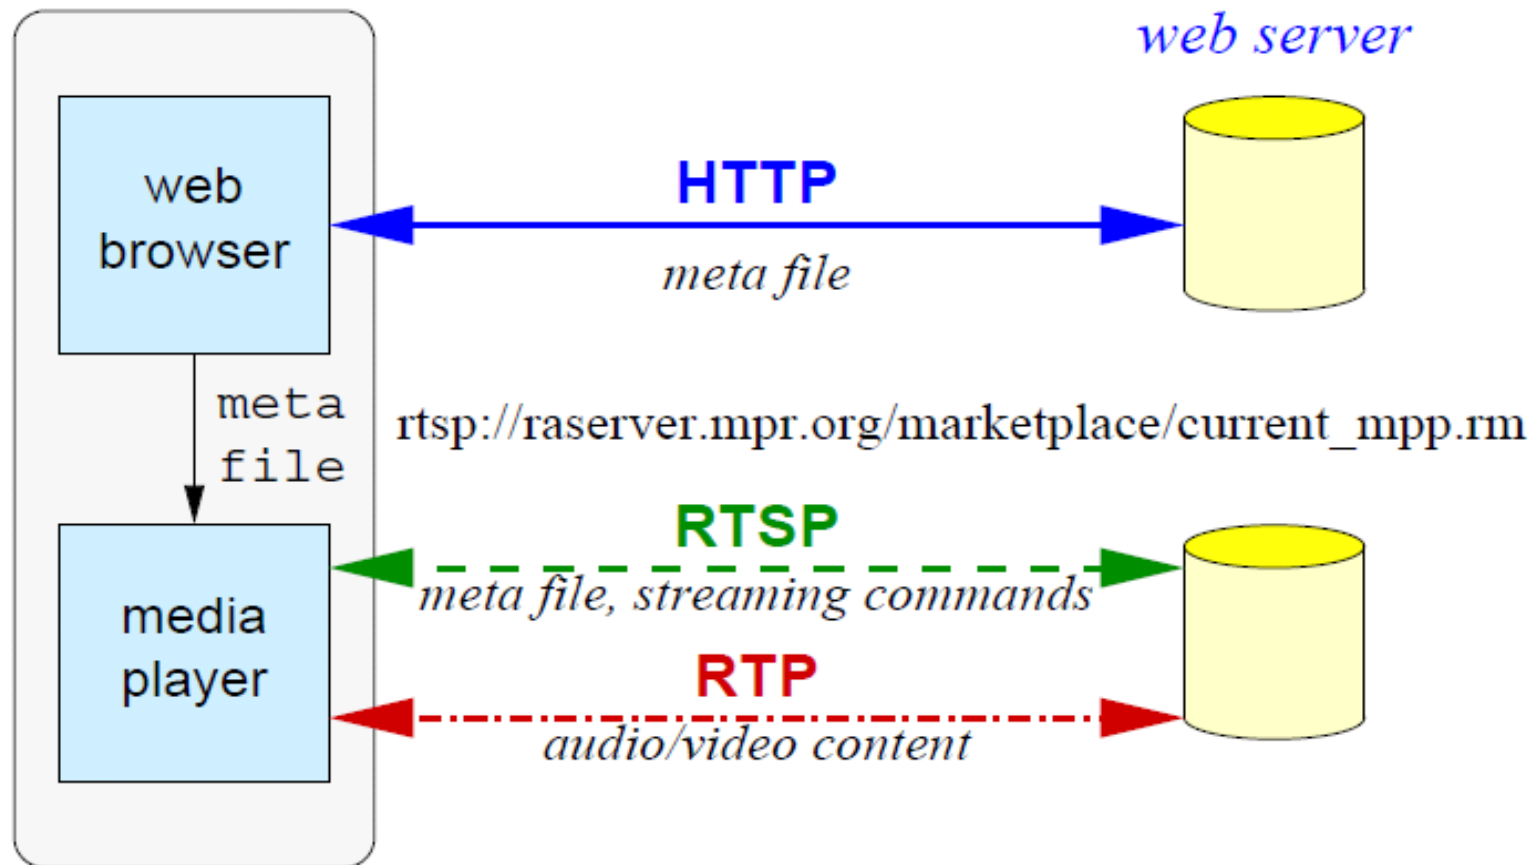

RTSP – Aggregate and Stream Control

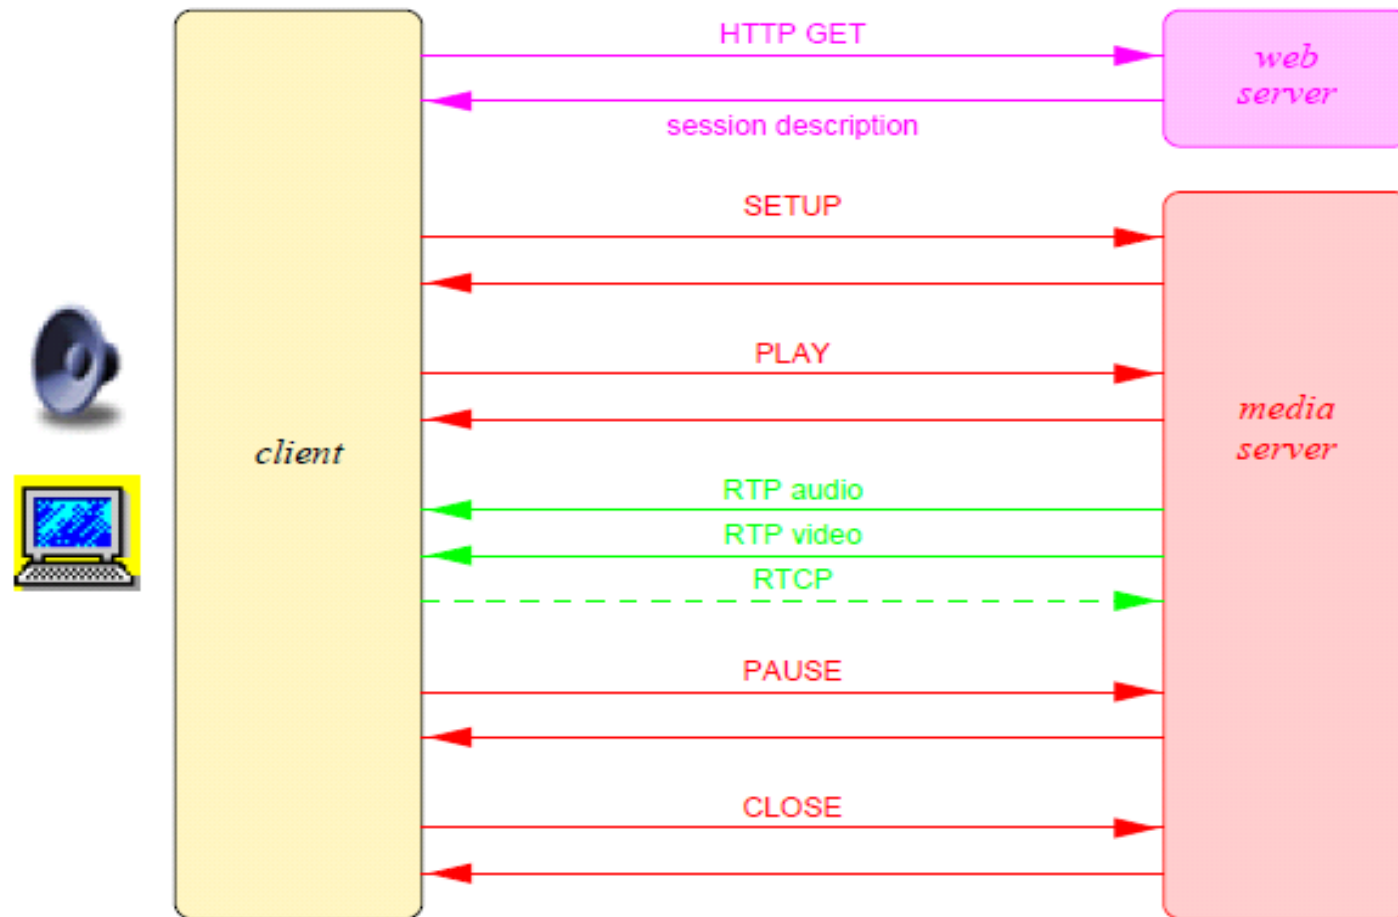

Streaming media: meta files

Streaming Media: RTSP

RTSP Operation

Session Description Protocol (SDP)

- **SDP is Text Format** for describing multimedia sessions
- Not really a protocol (similar to markup language like HTML)
- Can be carried in any protocol, e.g., RTSP or SIP
- Describes unicast and multicast sessions

SDP

- There are five terms related to multimedia session description:
 - **Conference:** It is a set of two or more communicating users along with the software they are using.
 - **Session :** Session is the multimedia sender and receiver and the flowing stream of data.
 - **Session Announcement:** A session announcement is a mechanism by which a session description is conveyed to users in a proactive fashion, i.e., the session description was not explicitly requested by the user.
 - **Session Advertisement :** same as session announcement
 - **Session Description :** A well defined format for conveying sufficient information to discover and participate in a multimedia session.

SDP Information

■ Session description

- v= (protocol version) ; o= (originator and session identifier)
- s= (session name) ; i=* (session information)
- u=* (URI of description) ; e=* (email address) p
- =* (phone number) ; c=* (connection information -- not required if included in all media) ; b=* (zero or more bandwidth information lines)
- **One or more time descriptions**
 - ("t=" and "r=" lines; see below) z=* (time zone adjustments) k=* (encryption key) a=* (zero or more session attribute lines)

■ Time description

- t= (time the session is active) ; r=* (zero or more repeat times)

■ Media description, if present

- m= (media name and transport address) ; i=* (media title)
- c=* (connection information -- optional if included at session level)
- b=* (zero or more bandwidth information lines)
- k=* (encryption key) a=* (zero or more media attribute lines)

Signaling for IP Telephony

- Internet Telephone – needs ability of one party to signal to other party to initiate a new call
- Call – association between a number of participants
 - Note: there is no physical channel or network resources associated with the session layer connection, the connection exists only as signaling state at two end points

IP Telephony Signaling Protocol (Requirements)

- Name translations and user location
 - Mapping between names of different levels of abstraction
 - Email address to IP address of host
- Feature negotiation
 - Group of end systems must agree on what media to exchange and their respective parameters
 - Different encodings, rates
- Call Participant Management
 - Invite participants to existing call, transfer call and hold other users

IP Telephony Signaling (Requirements)

- Feature change

- Adjust composition of media sessions during the course of call
 - Add or reduce functionality
 - Impose or remove constraints due to addition or removal of participants

- Two signaling protocols:

- **SIP** (IETF Standard)
 - **H.323** (ITU Standard)

SIP (Session Initiation Protocol)

- **SIP Goal**: invite new participants to call
- **Client-Server protocol** at the application level
- **Protocol**:
 - User/Client creates **requests** and sends to server;
 - User agent server **responds**;
- SIP requests can traverse many **proxy servers**
- Server may act as **redirect server**
- Proxies or redirect servers cannot accept/reject requests, only user agent server can
- Requests/Responses are **textual**

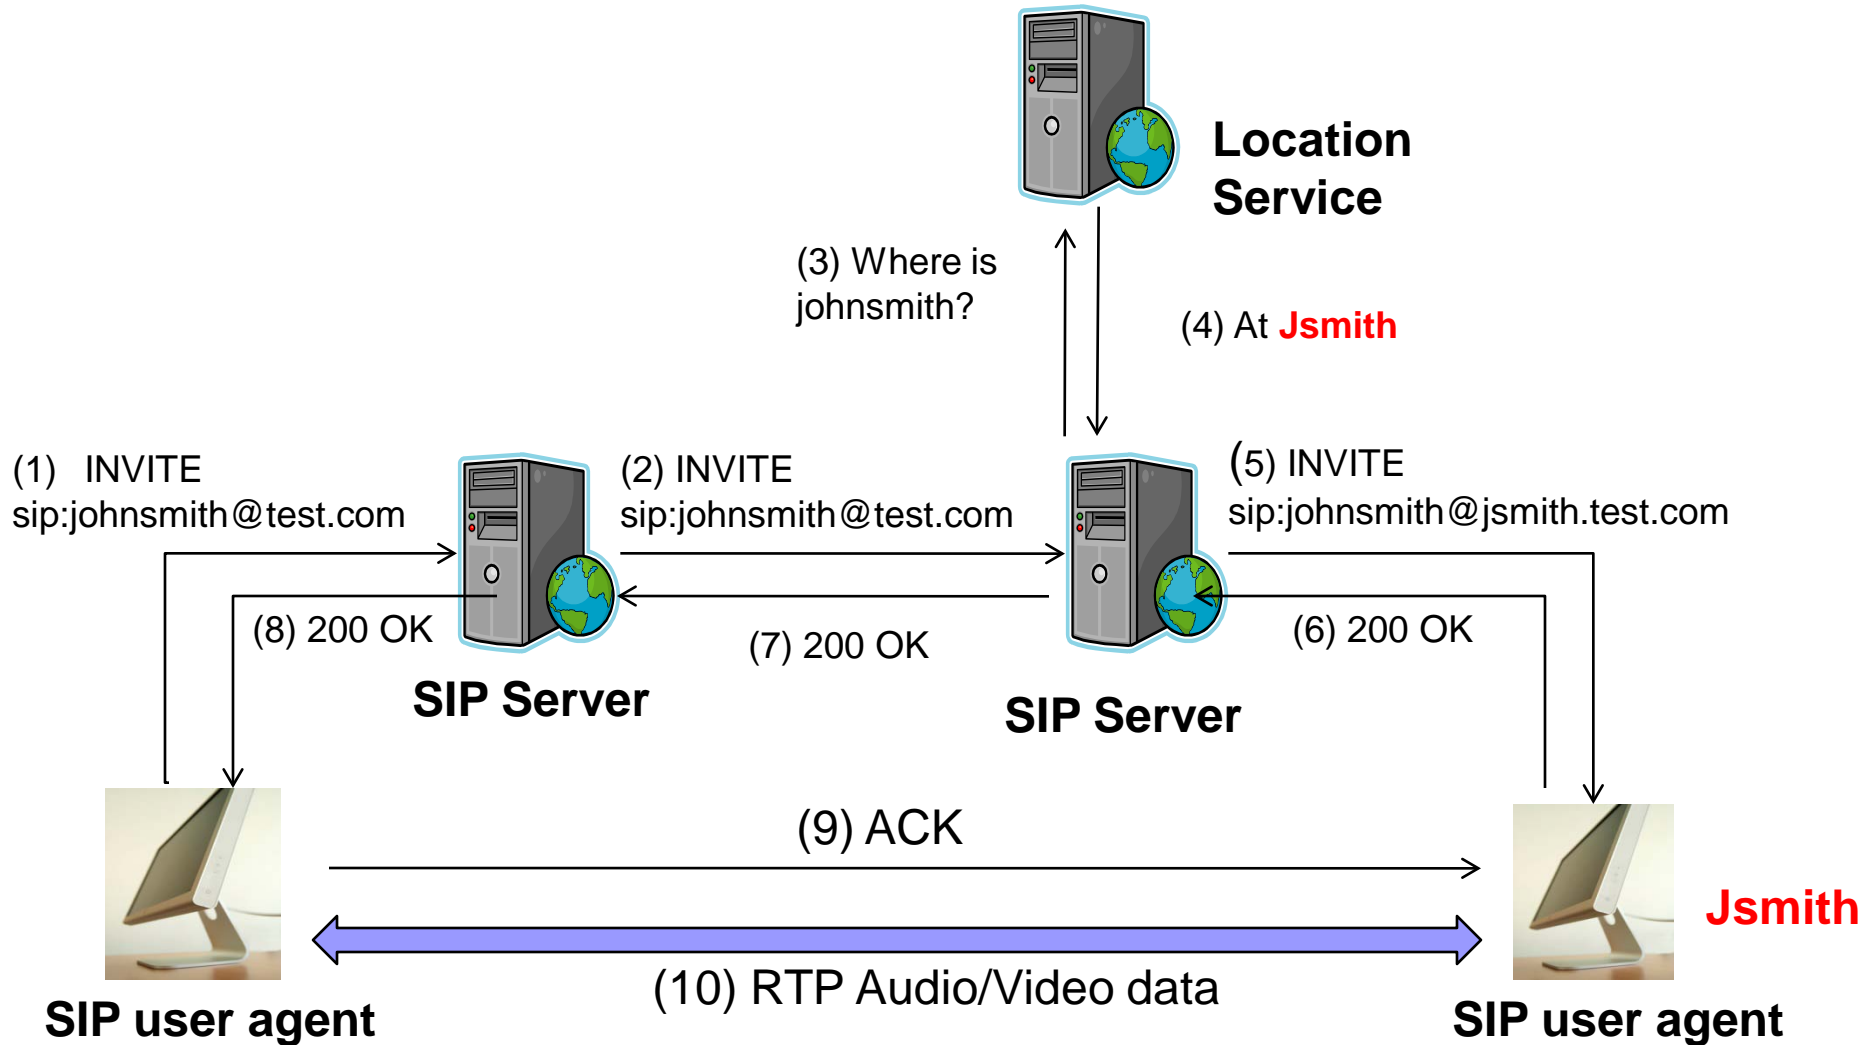

SIP - Message

- Calls in SIP – have **unique call ID** (carried in Call-ID header field of SIP message)
- Call identifier is created by the caller and used by all participants
- SIP messages have information
 - Logical connection source
 - Logical connection destination
 - Media destination
 - Media capabilities (use SDP)

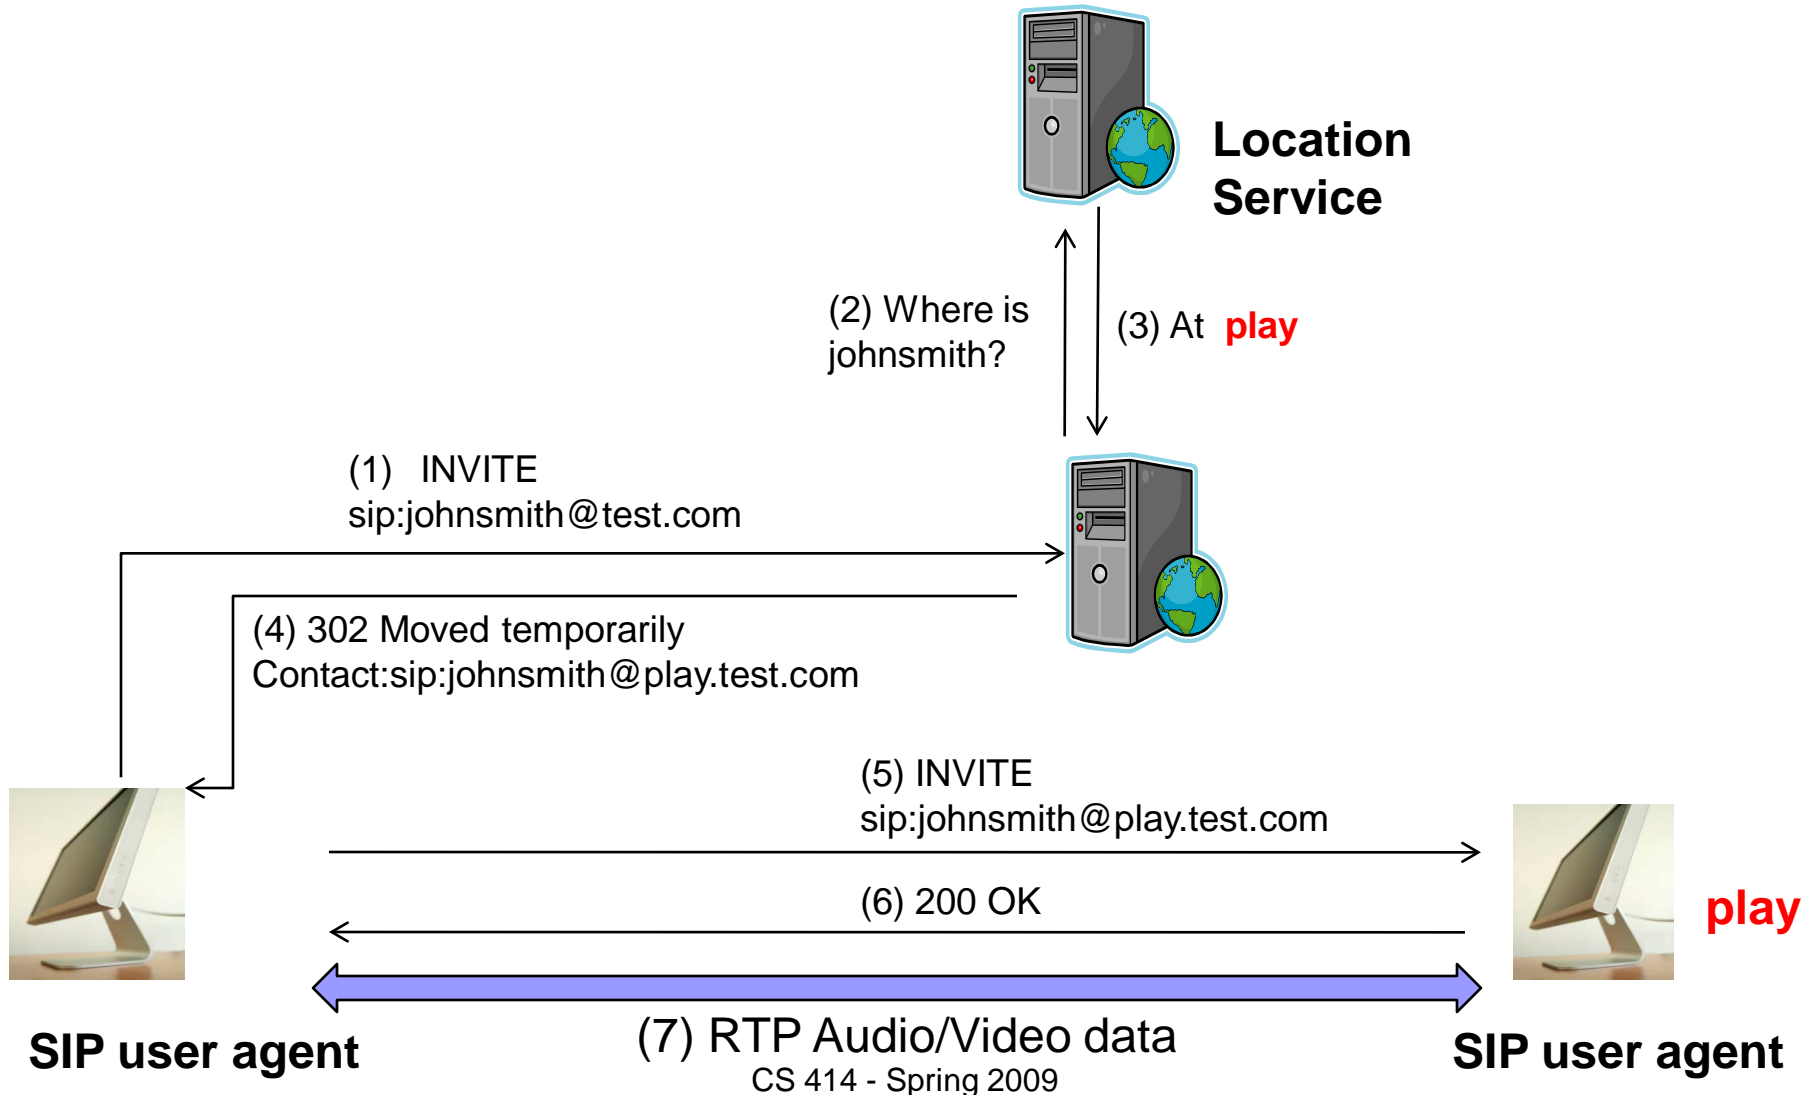

SIP – Addressing and Naming

- To be invited and identified, called party must be **named**
- SIP chooses email-like identifier
 - user@domain
 - user@host
 - user@IPAddress
 - phone-number@gateway
- SIP's address: part of SIP URL
 - sip:j.doe@example.com
 - URL can be placed on web page
- Interactive audio/video requests **translation**
 - name@domain to host@host

Call Setup Process using SIP

SIP Redirect Server Operation

SIP Requests/Methods

- INVITE—Indicates a client is being invited to participate in a call session.
- ACK—Confirms that the client has received a final response to an INVITE request.
- BYE—Terminates a call and can be sent by either the caller or the callee.
- CANCEL—Cancels any pending searches but does not terminate a call that has already been accepted.
- OPTIONS—Queries the capabilities of servers.
- REGISTER—Registers the address listed in the To header field with a SIP server.

SIP Responses

■ 1xx—Informational Responses

- 100 Trying (extended search being performed may take a significant time so a forking proxy must send a 100 Trying response)
- 180 Ringing
- 181 Call Is Being Forwarded
- 182 Queued
- 183 Session Progress

■ 2xx—Successful Responses

- 200 OK
- 202 accepted: It Indicates that the request has been understood but actually can't be processed

■ 3xx—Redirection Responses

- 300 Multiple Choices
- 301 Moved Permanently
- 302 Moved Temporarily

SAP – Session Announcement Protocol

- RTSP and SIP are designed for one-on-one session
- SAP is **multicast announcement protocol**
- Protocol
 - Distributed servers periodically send multicast packets (advertisements) containing descriptions of sessions generated by local sources
 - Advertisements are received by multicast receivers on well-known , static multicast address/port
- Advertisement contains SDP information to start media tools needed in the session

Conclusion

- Internet protocol suite has now basic ingredients to support streaming audio and video
 - Both for distribution and communication applications
- Challenges:
 - **No session control protocol that can be used to perform floor control in distributed multimedia conferences**
 - **Network reliability and deployment multicast of services with predictable quality-of-service are major hurdles beyond need for continuous upgrades in network capacity**
