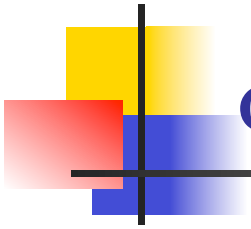
α Conversion

- α-conversion:

  λ x. exp --α--> λ y. (exp [y/x])

- Provided that

  1. y is not free in exp
  2. No free occurrence of x in exp becomes bound in exp when replaced by y



α Conversion Non-Examples

1. Error: y is not free in termsecond

   λ x. x y --α--> λ y. y y

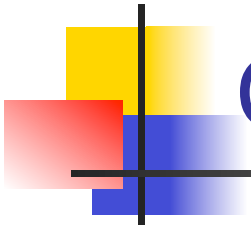
2. Error: free occurrence of x becomes bound in wrong way when replaced by y

   λ x. λ y. x y --α--> λ y. λ y. y y

   exp exp[y/x]

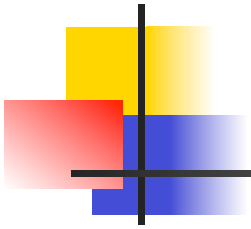
But λ x. (λ y. y) x --α--> λ y. (λ y. y) y

And λ y. (λ y. y) y --α--> λ x. (λ y. y) x



Congruence

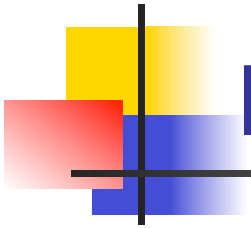
- Let ~ be a relation on lambda terms. ~ is a congruence if
- it is an equivalence relation
- If $e_1 \sim e_2$ then
  - $(e\ e_1) \sim (e\ e_2)$ and $(e_1 e) \sim (e_2\ e)$
  - $\lambda\ x.\ e_1 \sim \lambda\ x.\ e_2$



α Equivalence

- α equivalence is the smallest congruence containing α conversion

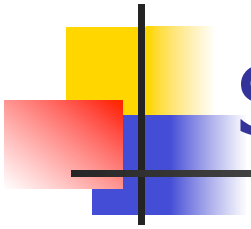
- One usually treats α-equivalent terms as equal - i.e. use α equivalence classes of terms



Example

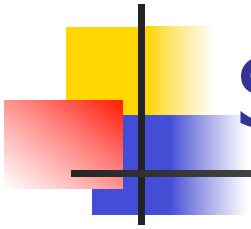
Show: λ x. (λ y. y x) x ~α~ λ y. (λ x. x y) y

- λ x. (λ y. y x) x --α--> λ z. (λ y. y z) z so
  λ x. (λ y. y x) x ~α~ λ z. (λ y. y z) z
- (λ y. y z) --α--> (λ x. x z) so
  (λ y. y z) ~α~ (λ x. x z) so
  λ z. (λ y. y z) z ~α~ λ z. (λ x. x z) z
- λ z. (λ x. x z) z --α--> λ y. (λ x. x y) y so
  λ z. (λ x. x z) z ~α~ λ y. (λ x. x y) y
- λ x. (λ y. y x) x ~α~ λ y. (λ x. x y) y



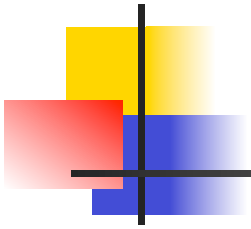
Substitution

- Defined on α-equivalence classes of terms
- P [N / x] means replace every free occurrence of x in P by N
  - P called *redex*; N called *residue*
- Provided that no variable free in P becomes bound in P [N / x]
  - Rename bound variables in P to avoid capturing free variables of N



Substitution

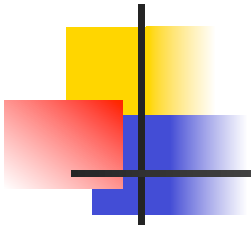
- $x\ [N / x] = N$
- $y\ [N / x] = y$ if $y \neq x$
- $(e_1\ e_2)\ [N / x] = ((e_1\ [N / x]\ )\ (e_2\ [N / x]\ ))$
- $(\lambda\ x.\ e)\ [N / x] = (\lambda\ x.\ e)$
- $(\lambda\ y.\ e)\ [N / x] = \lambda\ y.\ (e\ [N / x]\ )$
  provided $y \neq x$ and y not free in N
  - Rename y in redex if necessary



Example

$$(\lambda\ y.\ y\ z)\ [(\lambda\ x.\ x\ y)\ /\ z] = ?$$

- Problems?
  - z in redex in scope of y binding
  - y free in the residue
- $(\lambda\ y.\ y\ z)\ [(\lambda\ x.\ x\ y)\ /\ z]$ --α--> $(\lambda\ w.w\ z)\ [(\lambda\ x.\ x\ y)\ /\ z] =$ $\lambda\ w.\ w\ (\lambda\ x.\ x\ y)$



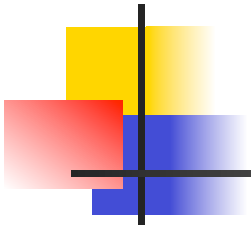
Example

- Only replace free occurrences
- $(\lambda\ y.\ y\ z\ (\lambda\ z.\ z))\ [(\lambda\ x.\ x)\ /\ z] =$

$$\lambda\ y.\ y\ (\lambda\ x.\ x)\ (\lambda\ z.\ z)$$

Not

$$\lambda\ y.\ y\ (\lambda\ x.\ x)\ (\lambda\ z.\ (\lambda\ x.\ x))$$



β reduction

- β Rule: (λ x. P) N --β--> P [N /x]
- Essence of computation in the lambda calculus
- Usually defined on α-equivalence classes of terms

Example

- (λ z. (λ x. x y) z) (λ y. y z)

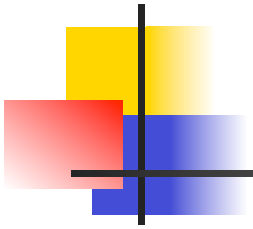
  --β--> (λ x. x y) (λ y. y z)

  --β--> (λ y. y z) y --β--> y z

- (λ x. x x) (λ x. x x)

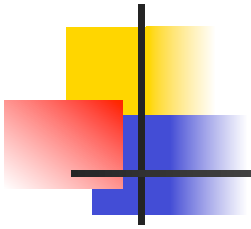
  --β--> (λ x. x x) (λ x. x x)

  --β--> (λ x. x x) (λ x. x x) --β--> ....



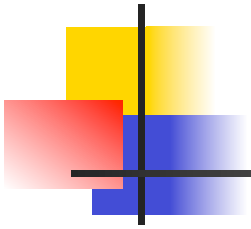
α β Equivalence

- α β equivalence is the smallest congruence containing α equivalence and β reduction
- A term is in *normal form* if no subterm is α equivalent to a term that can be β reduced
- Hard fact (Church-Rosser): if e_1 and e_2 are $\alpha\beta$-equivalent and both are normal forms, then they are α equivalent



Order of Evaluation

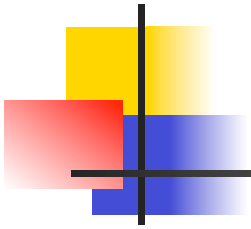
- Not all terms reduce to normal forms
- Not all reduction strategies will produce a normal form if one exists



Lazy evaluation:

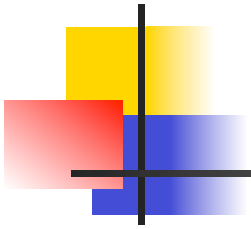
- Always reduce the left-most application in a top-most series of applications (i.e. Do not perform reduction inside an abstraction)

- Stop when term is not an application, or left-most application is not an application of an abstraction to a term



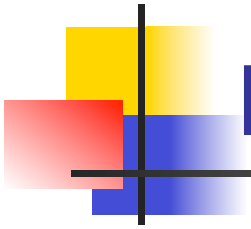
Example 1

- (λ z. (λ x. x)) ((λ y. y y) (λ y. y y))
- Lazy evaluation:
- Reduce the left-most application:
- (λ z. (λ x. x)) ((λ y. y y) (λ y. y y))
  --β--> (λ x. x)



Eager evaluation

- (Eagerly) reduce left of top application to an abstraction
- Then (eagerly) reduce argument
- Then β-reduce the application

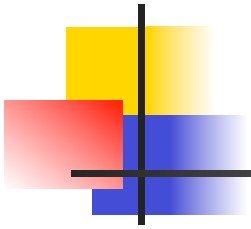


Example 1

- (λ z. (λ x. x))((λ y. y y) (λ y. y y))
- Eager evaluation:
- Reduce the rator of the top-most application to an abstraction: Done.
- Reduce the argument:
- (λ z. (λ x. x))((λ y. y y) (λ y. y y))

--β--> (λ z. (λ x. x))((λ y. y y) (λ y. y y))

--β--> (λ z. (λ x. x))((λ y. y y) (λ y. y y))…



Example 2

- (λ x. x x)((λ y. y y) (λ z. z))
- Lazy evaluation:

(λ x. x x)((λ y. y y) (λ z. z)) --β-->

- (λ x. x x)((λ y. y y) (λ z. z))
- Lazy evaluation:

(λ x. x x)((λ y. y y) (λ z. z)) --β-->

η (Eta) Reduction

- η Rule: λ x. f x --η--> f if x not free in f
  - Can be useful in each direction
  - Not valid in Ocaml
    - recall lambda-lifting and side effects
  - Not equivalent to (λ x. f) x --> f (inst of β)

- Example: λ x. (λ y. y) x --η--> λ y. y
