Programming Languages and Compilers (CS 421)

Elsa L Gunter

2112 SC, UIUC

http://courses.engr.illinois.edu/cs421

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

Warm-up Scoping Question

Consider this code:

```
let x = 27;;
let f x =
    let x = 5 in
        (fun x -> print_int x) 10;;
f 12;;
```

What value is printed?

5 10

12

27

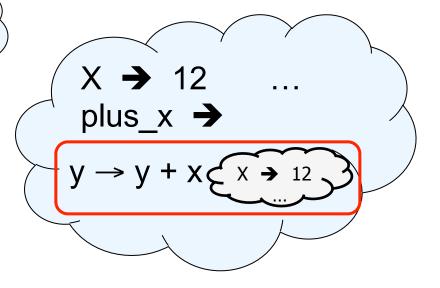

Recall: let plus_x = fun x => y + x

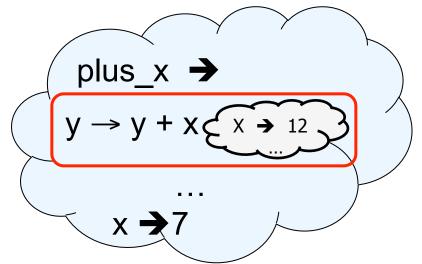

$$let x = 12$$

let plus_x = fun y => y + x

$$let x = 7$$

Closure for plus_x

When plus_x was defined, had environment:

$$\rho_{\text{plus } X} = \{..., X \rightarrow 12, ...\}$$

- Recall: let plus_x y = y + x
 is really let plus_x = fun y -> y + x
- Closure for fun y -> y + x:

$$\langle y \rightarrow y + x, \rho_{\text{plus } x} \rangle$$

Environment just after plus_x defined:

{plus_x
$$\rightarrow$$
 \rightarrow y + x, ρ_{plus_x} >} + ρ_{plus_x}

Functions on tuples

```
# let plus_pair (n,m) = n + m;;
val plus pair : int * int -> int = <fun>
# plus_pair (3,4);;
-: int = 7
# let double x = (x,x);;
val double : a \rightarrow a * a = < fun>
# double 3;;
-: int * int = (3, 3)
# double "hi";;
- : string * string = ("hi", "hi")
```

Your turn now

Try Problem 1 on MP2

Save the Environment!

 A closure is a pair of an environment and an association of a sequence of variables (the input variables) with an expression (the function body), written:

$$<$$
 (v1,...,vn) \rightarrow exp, $\rho >$

• Where ρ is the environment in effect when the function is defined (for a simple function)

Closure for plus_pair

- Assume ρ_{plus_pair} was the environment just before plus_pair defined
- Closure for fun (n,m) -> n + m:

$$<$$
(n,m) \rightarrow n + m, $\rho_{plus_pair}>$

Environment just after plus_pair defined:

{plus_pair → <(n,m) → n + m,
$$\rho_{plus_pair}$$
 >}
+ ρ_{plus_pair}

Your turn now

Functions with more than one argument

```
# let add_three x y z = x + y + z;;
val add three : int -> int -> int -> int = <fun>
# let t = add three 6 3 2;;
val t: int = 11
# let add three =
  fun x -> (fun y -> (fun z -> x + y + z));;
val add three: int -> int -> int -> int = <fun>
```

Again, first syntactic sugar for second

Your turn now

Try Problem 2 on MP2

Curried vs Uncurried

Recall

```
val add_three : int -> int -> int -> int = <fun>
```

How does it differ from

```
# let add_triple (u,v,w) = u + v + w;;
val add_triple : int * int * int -> int = <fun>
```

- add_three is curried;
- add_triple is uncurried

Curried vs Uncurried

```
# add_triple (6,3,2);;
-: int = 11
# add_triple 5 4;;
Characters 0-10:
 add_triple 5 4;;
  \wedge \wedge \wedge \wedge \wedge \wedge \wedge \wedge \wedge \wedge
This function is applied to too many arguments,
maybe you forgot a `;'
# fun x -> add_triple (5,4,x);;
: int -> int = <fun>
```

Partial application of functions

let add_three x y z = x + y + z;;

```
# let h = add_three 5 4;;
val h : int -> int = <fun>
# h 3;;
- : int = 12
# h 7;;
- : int = 16
```

Your turn now

Try (* 2 *) from HW2 Caution!

Know what the argument is and what the body is

Functions as arguments

```
# let thrice f x = f(f(f x));;
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
# let g = thrice plus two;;
val g : int -> int = < fun>
# q 4;;
-: int = 10
# thrice (fun s -> "Hi! " ^ s) "Good-bye!";;
-: string = "Hi! Hi! Hi! Good-bye!"
```

Your turn now

Try Problem 3 on MP2

Evaluating declarations

- Evaluation uses an environment p
- To evaluate a (simple) declaration let x = e
 - Evaluate expression e in ρ to value v
 - Update ρ with x v: $\{x \rightarrow v\} + \rho$
- Update: $\rho_1 + \rho_2$ has all the bindings in ρ_1 and all those in ρ_2 that are not rebound in ρ_1

$$\{x \to 2, y \to 3, a \to \text{``hi''}\} + \{y \to 100, b \to 6\}$$

= $\{x \to 2, y \to 3, a \to \text{``hi''}, b \to 6\}$

Evaluating expressions

- Evaluation uses an environment p
- A constant evaluates to itself
- To evaluate an variable, look it up in ρ (ρ (ν))
- To evaluate uses of +, _ , etc, eval args, then do operation
- Function expression evaluates to its closure
- To evaluate a local dec: et x = e1 in e2
 - Eval e1 to v, eval e2 using $\{x \rightarrow v\} + \rho$

Evaluation of Application with Closures

- In environment ρ , evaluate left term to closure, $c = \langle (x_1,...,x_n) \rightarrow b, \rho \rangle$
- $(x_1,...,x_n)$ variables in (first) argument
- Evaluate the right term to values, (v₁,...,v_n)
- Update the environment p to

$$\rho' = \{x_1 \rightarrow v_1, \dots, x_n \rightarrow v_n\} + \rho$$

Evaluate body b in environment ρ'

Evaluation of Application of plus_x;;

Have environment:

$$\rho = \{\text{plus}_x \to , \, ... \, , \\ y \to 3, \, ... \}$$
 where
$$\rho_{\text{plus}\ x} = \{x \to 12, \, ... \}$$

- Eval (plus_x y, ρ) rewrites to
- App ($\langle y \rightarrow y + x, \rho_{plus_x} \rangle$, 3) rewrites to
- Eval $(y + x, \{y \rightarrow 3\} + \rho_{\text{plus } x})$ rewrites to
- Eval $(3 + 12, \rho_{\text{plus}_X}) = 15$

Evaluation of Application of plus_pair

Assume environment

$$\rho = \{x \rightarrow 3..., \\ plus_pair \rightarrow <(n,m) \rightarrow n + m, \rho_{plus_pair}>\} + \\ \rho_{plus_pair}$$

- Eval (plus_pair (4,x), ρ)=
- App (<(n,m) \rightarrow n + m, $\rho_{plus_pair}>$, (4,3)) =
- Eval (n + m, {n -> 4, m -> 3} + ρ_{plus_pair}) =
- Eval $(4 + 3, \{n -> 4, m -> 3\} + \rho_{plus_pair}) = 7$

Your turn now

Try (* 3 *) from HW2

Closure question

If we start in an empty environment, and we execute:

```
let f = fun n -> n + 5;;
  (* 0 *)
let pair_map g (n,m) = (g n, g m);;
let f = pair_map f;;
let a = f (4,6);;
What is the environment at (* 0 *)?
```

let
$$f = fun n -> n + 5;;$$

$$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \}$$

Closure question

If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
let pair_map g (n,m) = (g n, g m);;
(* 1 *)
let f = pair_map f;;
let a = f (4,6);;
What is the environment at (* 1 *)?
```

Answer

```
\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}
let pair_map g (n,m) = (g n, g m);;
```

```
\rho_1 = \{ pair\_map \rightarrow \\
<g \rightarrow fun (n,m) -> (g n, g m), \\
\{f \rightarrow <n \rightarrow n + 5, \{ \}> \}>, \\
f \rightarrow <n \rightarrow n + 5, \{ \}> \}
```

Closure question

If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
let pair_map g (n,m) = (g n, g m);;
let f = pair_map f;;
(* 2 *)
let a = f (4,6);;
What is the environment at (* 2 *)?
```

Evaluate pair_map f

```
\begin{split} \rho_0 &= \{f \rightarrow < n \rightarrow n + 5, \{ \} > \} \\ \rho_1 &= \{ pair\_map \rightarrow < g \rightarrow fun \ (n,m) \ -> \ (g \ n, \ g \ m), \ \rho_0 >, \\ f \rightarrow < n \rightarrow n + 5, \{ \} > \} \\ \text{let } f &= pair\_map \ f;; \end{split}
```

Evaluate pair_map f

```
\begin{split} \rho_0 &= \{f \rightarrow < n \rightarrow n + 5, \{ \} > \} \\ \rho_1 &= \{ pair\_map \rightarrow < g \rightarrow fun \ (n,m) -> (g \ n, g \ m), \ \rho_0 >, \\ f \rightarrow < n \rightarrow n + 5, \{ \} > \} \\ Eval(pair\_map \ f, \ \rho_1) &= \end{split}
```

•

Evaluate pair_map f

```
\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}

\rho_1 = \{\text{pair\_map} \rightarrow \langle g \rightarrow \text{fun (n,m)} \rightarrow (g \text{ n, g m}), \rho_0 \rangle, f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}

Eval(pair\_map f, \rho_1) =
Eval(app (\langle g \rightarrow \text{fun (n,m)} \rightarrow (g \text{ n, g m}), \rho_0 \rangle, \langle n \rightarrow n + 5, \{ \} \rangle), \rho_1) =
```

Evaluate pair_map f

```
\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \}
\rho_1 = \{\text{pair\_map} \rightarrow <\text{g}\rightarrow\text{fun (n,m)} -> (\text{g n, g m}), \rho_0>,
           f \rightarrow < n \rightarrow n + 5, \{ \} > \}
Eval(pair_map f, \rho_1) =
Eval(app (\langle g \rightarrow fun (n,m) - \rangle (g n, g m), \rho_0 \rangle,
                   \langle n \rightarrow n + 5, \{ \} \rangle ), \rho_1 \rangle =
Eval(fun (n,m)->(q n, q m), \{q\rightarrow < n\rightarrow n + 5, \{ \}> \}+\rho_0)
=<(n,m)\rightarrow(g n, g m), \{g\rightarrow< n\rightarrow n + 5, \{ \}>\}+\rho_0>
=<(n,m)\rightarrow(q n, q m), \{q\rightarrow< n\rightarrow n + 5, \{ \}>
                                             f \rightarrow < n \rightarrow n + 5, \{ \} > \}
```

Answer

```
\rho_1 = \{ pair\_map \rightarrow
 \langle g \rightarrow fun(n,m) - \rangle (g n, g m), \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \} >
           f \to \langle n \to n + 5, \{ \} \rangle
let f = pair_map f;;
\rho_2 = \{f \rightarrow \langle (n,m) \rightarrow (g n, g m), equal for all forms are smaller for all forms are smaller for all f
                                                                                                                     \{q \to \langle n \to n + 5, \{ \} \rangle,
                                                                                                                          f \to \langle n \to n + 5, \{ \} \rangle \rangle
                                                              pair_map \rightarrow \langle q \rightarrow fun(n,m) - \rangle (q n, q m),
                                                                                                                                                                                                              \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \} \rangle
```

Closure question

If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
let pair_map g(n,m) = (g n, g m);;
let f = pair_map f;;
let a = f(4,6);;
(*3*)
What is the environment at (*3 *)?
```

Final Evalution?

Evaluate f (4,6);;

```
 \rho_2 = \{f \to <(n,m) \to (g \ n, g \ m), \\ \{g \to < n \to n + 5, \{ \} >, \\ f \to < n \to n + 5, \{ \} > \} >, \\ pair\_map \to < g \to fun (n,m) -> (g \ n, g \ m), \\ \{f \to < n \to n + 5, \{ \} > \} > \}  Eval(f (4,6), \rho_2) =
```

Evaluate f (4,6);;

```
\rho_2 = \{f \rightarrow \langle (n,m) \rightarrow (g n, g m), e^{-g}\}
                       \{q \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle,
                        f \to \langle n \to n + 5, \{ \} \rangle \rangle
            pair map \rightarrow \langle q \rightarrow fun(n,m) - \rangle (q n, q m),
                                        \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \} \rangle
Eval(f (4,6), \rho_2) =
Eval(app(<(n,m) \rightarrow(g n, g m),
                       \{q \to \langle n \to n + 5, \{ \} \rangle,
                        f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle , (4,6)), \rho_2) =
```

4

Evaluate f (4,6);;

```
Eval(app(<(n,m) \rightarrow(g n, g m),
                    \{q \to \langle n \to n + 5, \{ \} \rangle,
                     f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle \langle (4,6) \rangle, \rho_2 \rangle =
Eval((q n, q m), \{n \rightarrow 4, m \rightarrow 6\} +
                                 \{q \to \langle n \to n + 5, \{ \} \rangle,
                                  f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle ) =
Eval((app(< n \rightarrow n + 5, \{ \} >, 4),
         app (< n \rightarrow n + 5, \{ \} >, 6)),
       \{n \to 4, m \to 6, q \to (n \to n + 5, \{\})\}
                                     f \to \langle n \to n + 5, \{ \} \rangle \} =
```

4

Evaluate f (4,6);;

```
\rho_{3} = \{ n \rightarrow 4, m \rightarrow 6, g \rightarrow < n \rightarrow n + 5, \{ \} >, \}
                                    f \to \langle n \to n + 5, \{ \} \rangle \}
Eval((app(< n \rightarrow n + 5, \{ \} >, 4),
         app (\langle n \rightarrow n + 5, \{ \} \rangle, 6 \rangle), \rho_3) =
Eval((Eval(n + 5, \{n \rightarrow 4\} + \{\})),
       (Eval(n + 5, \{n \rightarrow 6\} + \{\})), \rho_3) =
Eval((Eval(4 + 5, \{n \rightarrow 4\} + \{\})),
       (Eval(6 + 5, \{n \rightarrow 6\} + \{\})), \rho_3) =
Eval((9, 11), \rho_3) = (9. 11)
```

Your turn now

Try (* 4 *) from HW2

4

Match Expressions

let triple_to_pair triple =

match triple

with
$$(0, x, y) \rightarrow (x, y)$$

$$(x, 0, y) \rightarrow (x, y)$$

$$(x, y, _) \rightarrow (x, y);;$$

- Each clause: pattern on left, expression on right
- Each x, y has scope of only its clause
- Use first matching clause

val triple_to_pair : int * int * int -> int * int =
 <fun>

-

Recursive Functions

```
# let rec factorial n =
    if n = 0 then 1 else n * factorial (n - 1);;
    val factorial : int -> int = <fun>
# factorial 5;;
- : int = 120
# (* rec is needed for recursive function declarations *)
```

Your turn now

Try Problem 4 on MP2

4

Recursion Example

```
Compute n^2 recursively using:

n^2 = (2 * n - 1) + (n - 1)^2

# let rec nthsq n = (* rec for recursion *)

match n (* pattern matching for cases *)

with 0 \rightarrow 0 (* base case *)

| n \rightarrow (2 * n - 1) (* recursive case *)

+ nthsq (n - 1);; (* recursive call *)

val nthsq : int -> int = <fun>
# nthsq 3;;
-: int = 9
```

Structure of recursion similar to inductive proof

Recursion and Induction

```
# let rec nthsq n = match n with 0 -> 0
| n -> (2 * n - 1) + nthsq (n - 1) ;;
```

- Base case is the last case; it stops the computation
- Recursive call must be to arguments that are somehow smaller - must progress to base case
- if or match must contain base case
- Failure of these may cause failure of termination

 First example of a recursive datatype (aka algebraic datatype)

 Unlike tuples, lists are homogeneous in type (all elements same type)

Lists

- List can take one of two forms:
 - Empty list, written []
 - Non-empty list, written x :: xs
 - x is head element, xs is tail list, :: called "cons"
 - Syntactic sugar: [x] == x :: []
 - [x1; x2; ...; xn] == x1 :: x2 :: ... :: xn :: []

Lists

```
# let fib5 = [8;5;3;2;1;1];;
val fib5 : int list = [8; 5; 3; 2; 1; 1]
# let fib6 = 13 :: fib5;;
val fib6 : int list = [13; 8; 5; 3; 2; 1; 1]
# (8::5::3::2::1::1::[ ]) = fib5;;
-: bool = true
# fib5 @ fib6;;
-: int list = [8; 5; 3; 2; 1; 1; 13; 8; 5; 3; 2; 1;
  1]
```

Lists are Homogeneous

```
# let bad_list = [1; 3.2; 7];;
Characters 19-22:
let bad_list = [1; 3.2; 7];;
```

This expression has type float but is here used with type int

Question

Which one of these lists is invalid?

- 1. [2; 3; 4; 6]
- 2. [2,3; 4,5; 6,7]
- **3.** [(2.3,4); (3.2,5); (6,7.2)]
- 4. [["hi"; "there"]; ["wahcha"]; []; ["doin"]]

Answer

Which one of these lists is invalid?

- 1. [2; 3; 4; 6]
- 2. [2,3; 4,5; 6,7]
- **3.** [(2.3,4); (3.2,5); (6,7.2)]
- 4. [["hi"; "there"]; ["wahcha"]; []; ["doin"]]
- 3 is invalid because of last pair

-

Functions Over Lists

```
# let rec double_up list =
   match list
   with [] -> [] (* pattern before ->,
                     expression after *)
     | (x :: xs) -> (x :: x :: double_up xs);;
val double_up : 'a list -> 'a list = <fun>
# let fib5 2 = double up fib5;;
val fib5_2 : int list = [8; 8; 5; 5; 3; 3; 2; 2; 1;
  1; 1; 1]
```

Functions Over Lists

```
# let silly = double_up ["hi"; "there"];;
val silly: string list = ["hi"; "hi"; "there"; "there"]
# let rec poor_rev list =
 match list
 with [] -> []
   | (x::xs) -> poor_rev xs @ [x];;
val poor_rev : 'a list -> 'a list = <fun>
# poor rev silly;;
-: string list = ["there"; "there"; "hi"; "hi"]
```

- Problem: write code for the length of the list
 - How to start?

let length I =

- Problem: write code for the length of the list
 - How to start?

let rec length I = match I with

- Problem: write code for the length of the list
 - What patterns should we match against?

let rec length I = match I with

- Problem: write code for the length of the list
 - What patterns should we match against?

```
let rec length I =
  match I with [] ->
  | (a :: bs) ->
```

4

Question: Length of list

- Problem: write code for the length of the list
 - What result do we give when I is empty?

```
let rec length I =
  match I with [] -> 0
  | (a :: bs) ->
```

- Problem: write code for the length of the list
 - What result do we give when I is not empty?

```
let rec length I =
  match I with [] -> 0
  | (a :: bs) ->
```

4

Question: Length of list

- Problem: write code for the length of the list
 - What result do we give when I is not empty?

Your turn now

Try Problem 6 on MP2

How can we efficiently answer if two lists have the same length?

Same Length

How can we efficiently answer if two lists have the same length?

```
let rec same length list1 list2 =
   match list1 with [] ->
     (match list2 with [] -> true
      (y::ys) -> false)
   (x::xs) ->
     (match list2 with [] -> false
      | (y::ys) -> same_length xs ys)
```

Higher Order Functions

- A function is higher-order if it takes a function as an argument or returns one as a result
- Example:

```
# let compose f g = fun x -> f (g x);;
val compose : ('a -> 'b) -> ('c -> 'a) -> 'c ->
  'b = <fun>
```

The type ('a -> 'b) -> ('c -> 'a) -> 'c -> 'b is a higher order type because of ('a -> 'b) and ('c -> 'a) and -> 'c -> 'b

Thrice

Recall:

```
# let thrice f x = f (f (f x));;
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

How do you write thrice with compose?

Thrice

Recall:

```
# let thrice f x = f (f (f x));;
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

How do you write thrice with compose?

```
# let thrice f = compose f (compose f f);;
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

Is this the only way?

Partial Application

```
# (+);;
- : int -> int -> int = <fun>
# (+) 2 3;;
-: int = 5
# let plus_two = (+) 2;;
val plus_two : int -> int = <fun>
# plus_two 7;;
-: int = 9
```

Patial application also called sectioning

Lambda Lifting

 You must remember the rules for evaluation when you use partial application

```
# let add_two = (+) (print_string "test\n"; 2);;
test
val add_two : int -> int = <fun>
# let add2 = (* lambda lifted *)
fun x -> (+) (print_string "test\n"; 2) x;;
val add2 : int -> int = <fun>
```

Lambda Lifting

```
# thrice add_two 5;;
- : int = 11
# thrice add2 5;;
test
test
test
- : int = 11
```

 Lambda lifting delayed the evaluation of the argument to (+) until the second argument was supplied

Partial Application and "Unknown Types"

Recall compose plus_two:

```
# let f1 = compose plus_two;;
val f1 : ('_a -> int) -> '_a -> int = <fun>
```

Compare to lambda lifted version:

```
# let f2 = fun g -> compose plus_two g;;
val f2 : ('a -> int) -> 'a -> int = <fun>
```

What is the difference?

Partial Application and "Unknown Types"

'_a can only be instantiated once for an expression

```
# f1 plus_two;;
- : int -> int = <fun>
# f1 List.length;;
Characters 3-14:
  f1 List.length;;
```

This expression has type 'a list -> int but is here used with type int -> int

Partial Application and "Unknown Types"

'a can be repeatedly instantiated

```
# f2 plus_two;;
-: int -> int = <fun>
# f2 List.length;;
-: '_a list -> int = <fun>
```

4

Functions Over Lists

```
# let rec map f list =
 match list
 with [] -> []
 | (h::t) -> (f h) :: (map f t);;
val map : ('a -> 'b) -> 'a list -> 'b list = <fun>
# map plus two fib5;;
-: int list = [10; 7; 5; 4; 3; 3]
# map (fun x -> x - 1) fib6;;
: int list = [12; 7; 4; 2; 1; 0; 0]
```

Iterating over lists

```
# let rec fold left f a list =
 match list
 with \lceil \rceil -> a
 | (x :: xs) -> fold_left f (f a x) xs;;
val fold left: ('a -> 'b -> 'a) -> 'a -> 'b list -> 'a =
  <fun>
# fold left
  (fun () -> print string)
  ["hi"; "there"];;
hithere-: unit = ()
```

Iterating over lists

```
# let rec fold_right f list b =
 match list
 with \lceil \rceil -> b
 | (x :: xs) -> f x (fold_right f xs b);;
val fold_right: ('a -> 'b -> 'b) -> 'a list -> 'b -> 'b =
  <fun>
# fold_right
   (fun s -> fun () -> print_string s)
   ["hi"; "there"]
   ();;
therehi-: unit = ()
```

Structural Recursion

- Functions on recursive datatypes (eg lists) tend to be recursive
- Recursion over recursive datatypes generally by structural recursion
 - Recursive calls made to components of structure of the same recursive type
 - Base cases of recursive types stop the recursion of the function

Structural Recursion: List Example

```
# let rec length list = match list
with [] -> 0 (* Nil case *)
| x :: xs -> 1 + length xs;; (* Cons case *)
val length : 'a list -> int = <fun>
# length [5; 4; 3; 2];;
- : int = 4
```

- Nil case [] is base case
- Cons case recurses on component list xs

Forward Recursion

- In Structural Recursion, split input into components and (eventually) recurse
- Forward Recursion form of Structural Recursion
- In forward recursion, first call the function recursively on all recursive components, and then build final result from partial results
- Wait until whole structure has been traversed to start building answer

4

Forward Recursion: Examples

```
# let rec double_up list =
   match list
  with [ ] -> [ ]
     | (x :: xs) -> (x :: x :: double_up xs);;
val double up : 'a list -> 'a list = <fun>
# let rec poor_rev list =
 match list
 with [] -> []
    (x::xs) -> poor_rev xs @ [x];;
val poor rev: 'a list -> 'a list = <fun>
```

4

Encoding Recursion with Fold

```
# let rec append list1 list2 = match list1 with
 [] -> list2 | x::xs -> x :: append xs list2;;
val append : 'a list -> 'a list -> 'a list = <fun>
                   Operation | Recursive Call
   Base Case
# let append list1 list2 =
  fold_right (fun x y -> x :: y) list1 list2;;
val append: 'a list -> 'a list -> 'a list = <fun>
# append [1;2;3] [4;5;6];;
-: int list = [1; 2; 3; 4; 5; 6]
```

Mapping Recursion

 One common form of structural recursion applies a function to each element in the structure

```
# let rec doubleList list = match list
with [] -> []
| x::xs -> 2 * x :: doubleList xs;;
val doubleList : int list -> int list = <fun>
# doubleList [2;3;4];;
- : int list = [4; 6; 8]
```

Mapping Recursion

 Can use the higher-order recursive map function instead of direct recursion

```
# let doubleList list =
   List.map (fun x -> 2 * x) list;;
val doubleList : int list -> int list = <fun>
# doubleList [2;3;4];;
- : int list = [4; 6; 8]
```

Same function, but no rec

Folding Recursion

 Another common form "folds" an operation over the elements of the structure

```
# let rec multList list = match list
with [] -> 1
| x::xs -> x * multList xs;;
val multList : int list -> int = <fun>
# multList [2;4;6];;
- : int = 48

Computes (2 * (4 * (6 * 1)))
```

Folding Recursion

- multList folds to the right
- Same as:

```
# let multList list =
    List.fold_right
    (fun x -> fun p -> x * p)
    list 1;;
val multList : int list -> int = <fun>
# multList [2;4;6];;
- : int = 48
```

How long will it take?

- Remember the big-O notation from CS 225 and CS 273
- Question: given input of size n, how long to generate output?
- Express output time in terms of input size, omit constants and take biggest power

How long will it take?

Common big-O times:

- Constant time O (1)
 - input size doesn't matter
- Linear time O(n)
 - double input ⇒ double time
- Quadratic time $O(n^2)$
 - double input ⇒ quadruple time
- **Exponential time** $O(2^n)$
 - increment input ⇒ double time

Linear Time

- Expect most list operations to take linear time O (n)
- Each step of the recursion can be done in constant time
- Each step makes only one recursive call
- List example: multList, append
- Integer example: factorial

Quadratic Time

- Each step of the recursion takes time proportional to input
- Each step of the recursion makes only one recursive call.
- List example:

Exponential running time

- Hideous running times on input of any size
- Each step of recursion takes constant time
- Each recursion makes two recursive calls
- Easy to write naïve code that is exponential for functions that can be linear

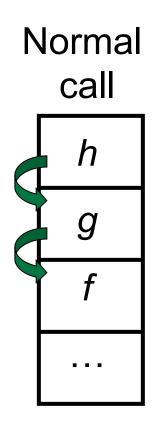

4

Exponential running time

```
# let rec naiveFib n = match n
with 0 -> 0
| 1 -> 1
| _ -> naiveFib (n-1) + naiveFib (n-2);;
val naiveFib : int -> int = <fun>
```

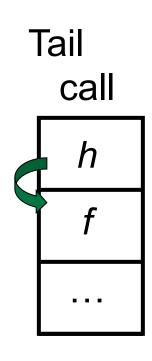

An Important Optimization

- When a function call is made, the return address needs to be saved to the stack so we know to where to return when the call is finished
- What if f calls g and g calls h, but calling h is the last thing g does (a tail call)?

An Important Optimization

- When a function call is made, the return address needs to be saved to the stack so we know to where to return when the call is finished
- What if f calls g and g calls h, but calling h is the last thing g does (a tail call)?
- Then h can return directly to f instead of g

Tail Recursion

- A recursive program is tail recursive if all recursive calls are tail calls
- Tail recursive programs may be optimized to be implemented as loops, thus removing the function call overhead for the recursive calls
- Tail recursion generally requires extra "accumulator" arguments to pass partial results
 - May require an auxiliary function

Tail Recursion - Example

```
# let rec rev_aux list revlist =
  match list with [ ] -> revlist
  | x :: xs -> rev_aux xs (x::revlist);;
val rev_aux : 'a list -> 'a list -> 'a list = <fun>
# let rev list = rev_aux list [ ];;
val rev : 'a list -> 'a list = <fun>
```

9/4/14

What is its running time?

Comparison

- poor_rev [1,2,3] =
- (poor_rev [2,3]) @ [1] =
- ((poor_rev [3]) @ [2]) @ [1] =
- (((poor_rev []) @ [3]) @ [2]) @ [1] =
- (([] @ [3]) @ [2]) @ [1]) =
- ([3] @ [2]) @ [1] =
- (3:: ([] @ [2])) @ [1] =
- **•** [3,2] @ [1] =
- **3** :: ([2] @ [1]) =
- 3 :: (2:: ([] @ [1])) = [3, 2, 1]

Comparison

- rev [1,2,3] =
- rev_aux [1,2,3] [] =
- rev_aux [2,3] [1] =
- rev_aux [3] [2,1] =
- rev_aux [][3,2,1] = [3,2,1]

Folding Functions over Lists

How are the following functions similar?

```
# let rec sumlist list = match list with
 [ ] -> 0 | x::xs -> x + sumlist xs;;
val sumlist : int list -> int = <fun>
# sumlist [2;3;4];;
-: int = 9
# let rec prodlist list = match list with
 [ ] -> 1 | x::xs -> x * prodlist xs;;
val prodlist : int list -> int = <fun>
# prodlist [2;3;4];;
-: int = 24
```

Folding

```
# let rec fold left f a list = match list
  with [] -> a | (x :: xs) -> fold_left f (f a x) xs;;
val fold_left: ('a -> 'b -> 'a) -> 'a -> 'b list -> 'a =
   <fun>
fold_left f a [x_1; x_2; ...; x_n] = f(...(f (f a <math>x_1) x_2)...)x_n
# let rec fold right f list b = match list
  with \lceil \rceil -> b \mid (x :: xs) -> f x (fold_right f xs b);;
val fold_right: ('a -> 'b -> 'b) -> 'a list -> 'b -> 'b =
   <fun>
fold_right f [x_1; x_2;...;x_n] b = f x_1(f x_2 (...(f x_n b)...))
```

4

Folding - Forward Recursion

```
# let sumlist list = fold_right (+) list 0;;
val sumlist: int list -> int = <fun>
# sumlist [2;3;4];;
-: int = 9
# let prodlist list = fold_right ( * ) list 1;;
val prodlist : int list -> int = <fun>
# prodlist [2;3;4];;
-: int = 24
```

-

Folding - Tail Recursion

```
# let rev list =
fold_left
(fun I -> fun x -> x :: I) //comb op
[] //accumulator cell
list
```

Folding

- Can replace recursion by fold_right in any forward primitive recursive definition
 - Primitive recursive means it only recurses on immediate subcomponents of recursive data structure
- Can replace recursion by fold_left in any tail primitive recursive definition
