

Programming Languages and Compilers (CS 421)

Elsa L Gunter

2112 SC, UIUC

<http://courses.engr.illinois.edu/cs421>

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

General Input

{ *header* }

let *ident* = *regex* ...

rule *entrypoint* [*arg1*... *argn*] = parse
 regex { *action* }

| ...

| *regex* { *action* }

and *entrypoint* [*arg1*... *argn*] =
 parse ...and ...

{ *trailer* }

Ocamlex Input

- *header* and *trailer* contain arbitrary ocaml code put at top and bottom of *<filename>.ml*
- `let ident = regexp ...` Introduces *ident* for use in later regular expressions

Ocamlex Input

- *<filename>.ml* contains one lexing function per *entrypoint*
 - Name of function is name given for *entrypoint*
 - Each entry point becomes an Ocaml function that takes $n+1$ arguments, the extra implicit last argument being of type `Lexing.lexbuf`
- *arg1... argn* are for use in *action*

Ocamlex Regular Expression

- Single quoted characters for letters:
‘a’
- `_`: (underscore) matches any letter
- `Eof`: special “end_of_file” marker
- Concatenation same as usual
- “*string*”: concatenation of sequence of characters
- e_1 / e_2 : choice - what was $e_1 \vee e_2$

Ocamlex Regular Expression

- $[c_1 - c_2]$: choice of any character between first and second inclusive, as determined by character codes
- $[^c_1 - c_2]$: choice of any character NOT in set
- e^* : same as before
- $e+$: same as $e e^*$
- $e?$: option - was $e_1 \vee \varepsilon$

Ocamlex Regular Expression

- $e_1 \# e_2$: the characters in e_1 but not in e_2 ; e_1 and e_2 must describe just sets of characters
- *ident*: abbreviation for earlier reg exp in `let ident = regexp`
- e_1 *as id*: binds the result of e_1 to *id* to be used in the associated *action*

Ocamllex Manual

- More details can be found at

[http://caml.inria.fr/pub/docs/manual-ocaml/
manual026.html](http://caml.inria.fr/pub/docs/manual-ocaml/manual026.html)

Example : test.ml

```
{ type result = Int of int | Float of float |  
  String of string }
```

```
let digit = ['0'-'9']
```

```
let digits = digit +
```

```
let lower_case = ['a'-'z']
```

```
let upper_case = ['A'-'Z']
```

```
let letter = upper_case | lower_case
```

```
let letters = letter +
```

Example : test.ml

```
rule main = parse
  (digits)'.'digits as f { Float (float_of_string f) }
| digits as n           { Int (int_of_string n) }
| letters as s          { String s}
| _ { main lexbuf }
{ let newlexbuf = (Lexing.from_channel stdin) in
  print_string "Ready to lex.";
  print_newline ();
  main newlexbuf }
```

Example

```
# #use "test.ml";;
```

```
...
```

```
val main : Lexing.lexbuf -> result = <fun>
```

```
val __ocaml_lex_main_rec : Lexing.lexbuf -> int ->  
  result = <fun>
```

Ready to lex.

hi there 234 5.2

```
- : result = String "hi"
```

What happened to the rest?!?

Example

```
# let b = Lexing.from_channel stdin;;
```

```
# main b;;
```

```
hi 673 there
```

```
- : result = String "hi"
```

```
# main b;;
```

```
- : result = Int 673
```

```
# main b;;
```

```
- : result = String "there"
```

Your Turn

- Work on MP8
 - Add a few keywords
 - Implement booleans and unit
 - Implement Ints and Floats
 - Implement identifiers

Problem

- How to get lexer to look at more than the first token at one time?
- One Answer: *action* tells it to -- recursive calls
- Side Benefit: can add “state” into lexing
- Note: already used this with the `_` case

Example

rule main = parse

(digits) '.' digits as f { Float

(float_of_string f) :: **main lexbuf**}

| digits as n { Int (int_of_string n) ::
main lexbuf }

| letters as s { String s :: **main lexbuf**}

| eof { [] }

| _ { **main lexbuf** }

Example Results

Ready to lex.

hi there 234 5.2

- : result list = [String "hi"; String "there"; Int 234; Float 5.2]

#

Used Ctrl-d to send the end-of-file signal

Dealing with comments

First Attempt

```
let open_comment = "("*
```

```
let close_comment = "*"
```

```
rule main = parse
```

```
  (digits) '.' digits as f { Float (float_of_string  
f) :: main lexbuf }
```

```
| digits as n          { Int (int_of_string n) ::  
main lexbuf }
```

```
| letters as s         { String s :: main lexbuf }
```

Dealing with comments

| **open_comment** { comment lexbuf }

| eof { [] }

| _ { main lexbuf }

and **comment** = parse

close_comment { main lexbuf }

| _ { **comment lexbuf** }

Dealing with nested comments

rule main = parse ...

| open_comment { comment 1 lexbuf }

| eof { [] }

| _ { main lexbuf }

and comment depth = parse

open_comment { comment (depth+1)
lexbuf }

| close_comment { if depth = 1
then main lexbuf
else comment (depth - 1) lexbuf }

| _ { comment depth lexbuf }

Dealing with nested comments

rule main = parse

(digits) '.' digits as f { Float (float_of_string f) ::
main lexbuf }

| digits as n { Int (int_of_string n) :: main
lexbuf }

| letters as s { String s :: main lexbuf }

| open_comment { (comment 1 lexbuf }

| eof { [] }

| _ { main lexbuf }

Dealing with nested comments

and comment depth = parse

open_comment { comment (depth+1) lexbuf }

| close_comment { if depth = 1

then main lexbuf

else comment (depth - 1) lexbuf }

| _ { comment depth lexbuf }

Types of Formal Language Descriptions

- Regular expressions, regular grammars
- Context-free grammars, BNF grammars, syntax diagrams
- Finite state automata

- Whole family more of grammars and automata – covered in automata theory

Sample Grammar

- Language: Parenthesized sums of 0's and 1's
- $\langle \text{Sum} \rangle ::= 0$
- $\langle \text{Sum} \rangle ::= 1$
- $\langle \text{Sum} \rangle ::= \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$
- $\langle \text{Sum} \rangle ::= (\langle \text{Sum} \rangle)$

BNF Grammars

- Start with a set of characters, **a,b,c,...**
 - We call these *terminals*
- Add a set of different characters, **X,Y,Z,**
...
 - We call these *nonterminals*
- One special nonterminal **S** called *start symbol*

BNF Grammars

- BNF rules (aka *productions*) have form

$$\mathbf{X} ::= y$$

where \mathbf{X} is any nonterminal and y is a string of terminals and nonterminals

- BNF *grammar* is a set of BNF rules such that every nonterminal appears on the left of some rule

Sample Grammar

- Terminals: 0 1 + ()
- Nonterminals: $\langle \text{Sum} \rangle$
- Start symbol = $\langle \text{Sum} \rangle$

- $\langle \text{Sum} \rangle ::= 0$
- $\langle \text{Sum} \rangle ::= 1$
- $\langle \text{Sum} \rangle ::= \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$
- $\langle \text{Sum} \rangle ::= (\langle \text{Sum} \rangle)$
- Can be abbreviated as
$$\langle \text{Sum} \rangle ::= 0 \mid 1 \mid \langle \text{Sum} \rangle + \langle \text{Sum} \rangle \mid (\langle \text{Sum} \rangle)$$

BNF Derivations

- Given rules

$$\mathbf{X} ::= y\mathbf{Z}w \text{ and } \mathbf{Z} ::= v$$

we may replace \mathbf{Z} by v to say

$$\mathbf{X} \Rightarrow y\mathbf{Z}w \Rightarrow yvw$$

- Sequence of such replacements called *derivation*
- Derivation called *right-most* if always replace the right-most non-terminal

BNF Derivations

- Start with the start symbol:

$\langle \text{Sum} \rangle \Rightarrow$

BNF Derivations

- Pick a non-terminal

<Sum> =>

BNF Derivations

- Pick a rule and substitute:

- $\langle \text{Sum} \rangle ::= \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\langle \text{Sum} \rangle \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

BNF Derivations

- Pick a non-terminal:

$\langle \text{Sum} \rangle \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

BNF Derivations

- Pick a rule and substitute:

- $\langle \text{Sum} \rangle ::= (\langle \text{Sum} \rangle)$

$$\langle \text{Sum} \rangle \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$$

$$\Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$$

BNF Derivations

- Pick a non-terminal:

$$\begin{aligned}\langle \text{Sum} \rangle & \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle \\ & \Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle\end{aligned}$$

BNF Derivations

- Pick a rule and substitute:

- $\langle \text{Sum} \rangle ::= \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\langle \text{Sum} \rangle \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + \langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

BNF Derivations

- Pick a non-terminal:

$\langle \text{Sum} \rangle \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + \langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

BNF Derivations

- Pick a rule and substitute:

- $\langle \text{Sum} \rangle ::= 1$

$\langle \text{Sum} \rangle \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + \langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + 1) + \langle \text{Sum} \rangle$

BNF Derivations

- Pick a non-terminal:

$$\begin{aligned}\langle \text{Sum} \rangle &\Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle \\ &\Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle \\ &\Rightarrow (\langle \text{Sum} \rangle + \langle \text{Sum} \rangle) + \langle \text{Sum} \rangle \\ &\Rightarrow (\langle \text{Sum} \rangle + 1) + \langle \text{Sum} \rangle\end{aligned}$$

BNF Derivations

- Pick a rule and substitute:

- $\langle \text{Sum} \rangle ::= 0$

$\langle \text{Sum} \rangle \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + \langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + 1) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + 1) + 0$

BNF Derivations

- Pick a non-terminal:

$$\begin{aligned}\langle \text{Sum} \rangle &\Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle \\ &\Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle \\ &\Rightarrow (\langle \text{Sum} \rangle + \langle \text{Sum} \rangle) + \langle \text{Sum} \rangle \\ &\Rightarrow (\langle \text{Sum} \rangle + 1) + \langle \text{Sum} \rangle \\ &\Rightarrow (\langle \text{Sum} \rangle + 1) + 0\end{aligned}$$

BNF Derivations

- Pick a rule and substitute

- $\langle \text{Sum} \rangle ::= 0$

$\langle \text{Sum} \rangle \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + \langle \text{Sum} \rangle) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + 1) + \langle \text{Sum} \rangle$

$\Rightarrow (\langle \text{Sum} \rangle + 1) 0$

$\Rightarrow (0 + 1) + 0$

BNF Derivations

- $(0 + 1) + 0$ is generated by grammar

$$\begin{aligned} \langle \text{Sum} \rangle & \Rightarrow \langle \text{Sum} \rangle + \langle \text{Sum} \rangle \\ & \Rightarrow (\langle \text{Sum} \rangle) + \langle \text{Sum} \rangle \\ & \Rightarrow (\langle \text{Sum} \rangle + \langle \text{Sum} \rangle) + \langle \text{Sum} \rangle \\ & \Rightarrow (\langle \text{Sum} \rangle + 1) + \langle \text{Sum} \rangle \\ & \Rightarrow (\langle \text{Sum} \rangle + 1) + 0 \\ & \Rightarrow (0 + 1) + 0 \end{aligned}$$

$\langle \text{Sum} \rangle ::= 0 \mid 1 \mid \langle \text{Sum} \rangle + \langle \text{Sum} \rangle \mid (\langle \text{Sum} \rangle)$

$\langle \text{Sum} \rangle \Rightarrow$

BNF Semantics

- The meaning of a BNF grammar is the set of all strings consisting only of terminals that can be derived from the Start symbol

Regular Grammars

- Subclass of BNF
- Only rules of form
 $\langle \text{nonterminal} \rangle ::= \langle \text{terminal} \rangle \langle \text{nonterminal} \rangle$ or
 $\langle \text{nonterminal} \rangle ::= \langle \text{terminal} \rangle$ or
 $\langle \text{nonterminal} \rangle ::= \varepsilon$
- Defines same class of languages as regular expressions
- Important for writing lexers (programs that convert strings of characters into strings of tokens)
- Close connection to nondeterministic finite state automata – nonterminals \cong states; rule \cong edge

Example

- Regular grammar:

$\langle \text{Balanced} \rangle ::= \varepsilon$

$\langle \text{Balanced} \rangle ::= 0 \langle \text{OneAndMore} \rangle$

$\langle \text{Balanced} \rangle ::= 1 \langle \text{ZeroAndMore} \rangle$

$\langle \text{OneAndMore} \rangle ::= 1 \langle \text{Balanced} \rangle$

$\langle \text{ZeroAndMore} \rangle ::= 0 \langle \text{Balanced} \rangle$

- Generates even length strings where every initial substring of even length has same number of 0's as 1's

Extended BNF Grammars

- Alternatives: allow rules of form $X ::= y/z$
 - Abbreviates $X ::= y, X ::= z$
- Options: $X ::= y[v]z$
 - Abbreviates $X ::= yvz, X ::= yz$
- Repetition: $X ::= y\{v\}^*z$
 - Can be eliminated by adding new nonterminal V and rules $X ::= yz, X ::= yVz, V ::= v, V ::= w$

Parse Trees

- Graphical representation of derivation
- Each node labeled with either non-terminal or terminal
- If node is labeled with a terminal, then it is a leaf (no sub-trees)
- If node is labeled with a non-terminal, then it has one branch for each character in the right-hand side of rule used to substitute for it

Example

- Consider grammar:

$$\langle \text{exp} \rangle ::= \langle \text{factor} \rangle$$
$$\quad \quad \quad | \langle \text{factor} \rangle + \langle \text{factor} \rangle$$
$$\langle \text{factor} \rangle ::= \langle \text{bin} \rangle$$
$$\quad \quad \quad | \langle \text{bin} \rangle * \langle \text{exp} \rangle$$
$$\langle \text{bin} \rangle ::= 0 \quad | \quad 1$$

- Problem: Build parse tree for $1 * 1 + 0$ as an $\langle \text{exp} \rangle$

Example cont.

- $1 * 1 + 0$: $\langle \text{exp} \rangle$

$\langle \text{exp} \rangle$ is the start symbol for this parse tree

Example cont.

■ $1 * 1 + 0$: $\langle \text{exp} \rangle$
|
 $\langle \text{factor} \rangle$

Use rule: $\langle \text{exp} \rangle ::= \langle \text{factor} \rangle$

Example cont.

- 1 * 1 + 0:

Use rule: $\langle \text{factor} \rangle ::= \langle \text{bin} \rangle * \langle \text{exp} \rangle$

Example cont.

- $1 * 1 + 0$:

Use rules: $\langle \text{bin} \rangle ::= 1$ and
 $\langle \text{exp} \rangle ::= \langle \text{factor} \rangle + \langle \text{factor} \rangle$

Example cont.

- $1 * 1 + 0$:

Use rule: $\langle \text{factor} \rangle ::= \langle \text{bin} \rangle$

Example cont.

- $1 * 1 + 0$:

Use rules: $\langle \text{bin} \rangle ::= 1 \mid 0$

Example cont.

- 1 * 1 + 0:

Fringe of tree is string generated by grammar

Your Turn: $1 * 0 + 0 * 1$

Parse Tree Data Structures

- Parse trees may be represented by OCaml datatypes
- One datatype for each nonterminal
- One constructor for each rule
- Defined as mutually recursive collection of datatype declarations

Example

- Recall grammar:
 $\langle \text{exp} \rangle ::= \langle \text{factor} \rangle \mid \langle \text{factor} \rangle + \langle \text{factor} \rangle$
 $\langle \text{factor} \rangle ::= \langle \text{bin} \rangle \mid \langle \text{bin} \rangle * \langle \text{exp} \rangle$
 $\langle \text{bin} \rangle ::= 0 \mid 1$
- type exp = Factor2Exp of factor
 | Plus of factor * factor
and factor = Bin2Factor of bin
 | Mult of bin * exp
and bin = Zero | One

Example cont.

- $1 * 1 + 0$:

Example cont.

- Can be represented as

Factor2Exp

(Mult(One,

Plus(Bin2Factor One,

Bin2Factor Zero)))

Ambiguous Grammars and Languages

- A BNF grammar is *ambiguous* if its language contains strings for which there is more than one parse tree
- If all BNF's for a language are ambiguous then the language is *inherently ambiguous*

Example: Ambiguous Grammar

■ $0 + 1 + 0$

Example

- What is the result for:

$$3 + 4 * 5 + 6$$

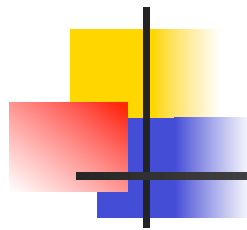

Example

- What is the result for:

$$3 + 4 * 5 + 6$$

- Possible answers:

- $41 = ((3 + 4) * 5) + 6$
- $47 = 3 + (4 * (5 + 6))$
- $29 = (3 + (4 * 5)) + 6 = 3 + ((4 * 5) + 6)$
- $77 = (3 + 4) * (5 + 6)$

Example

- What is the value of:

$$7 - 5 - 2$$

Example

- What is the value of:

$$7 - 5 - 2$$

- Possible answers:
 - In Pascal, C++, SML assoc. left
$$7 - 5 - 2 = (7 - 5) - 2 = 0$$
 - In APL, associate to right
$$7 - 5 - 2 = 7 - (5 - 2) = 4$$

Two Major Sources of Ambiguity

- Lack of determination of operator precedence
- Lack of determination of operator associativity
- Not the only sources of ambiguity
