

Programming Languages and Compilers (CS 421)

Elsa L Gunter
2112 SC, UIUC

<https://courses.engr.illinois.edu/cs421/fa2017/CS421D>

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

Booleans (aka Truth Values)

```
# true;;
```

```
- : bool = true
```

```
# false;;
```

```
- : bool = false
```

```
//  $\rho_7 = \{c \rightarrow 4, \text{test} \rightarrow 3.7, a \rightarrow 1, b \rightarrow 5\}$ 
```

```
# if b > a then 25 else 0;;
```

```
- : int = 25
```

Booleans and Short-Circuit Evaluation

```
# 3 > 1 && 4 > 6;;
```

```
- : bool = false
```

```
# 3 > 1 || 4 > 6;;
```

```
- : bool = true
```

```
# (print_string "Hi\n"; 3 > 1) || 4 > 6;;
```

```
Hi
```

```
- : bool = true
```

```
# 3 > 1 || (print_string "Bye\n"; 4 > 6);;
```

```
- : bool = true
```

```
# not (4 > 6);;
```

```
- : bool = true
```

Tuples as Values

```
//  $\rho_7 = \{c \rightarrow 4, \text{test} \rightarrow 3.7,$   
           $a \rightarrow 1, b \rightarrow 5\}$ 
```

```
# let s = (5, "hi", 3.2);;
```

```
val s : int * string * float = (5, "hi", 3.2)
```

```
//  $\rho_8 = \{s \rightarrow (5, \text{"hi"}, 3.2),$   
           $c \rightarrow 4, \text{test} \rightarrow 3.7,$   
           $a \rightarrow 1, b \rightarrow 5\}$ 
```

Pattern Matching with Tuples

```
/ ρ8 = {s → (5, "hi", 3.2),  
         c → 4, test → 3.7,  
         a → 1, b → 5}
```

```
# let (a,b,c) = s;; (* (a,b,c) is a pattern *)
```

```
val a : int = 5
```

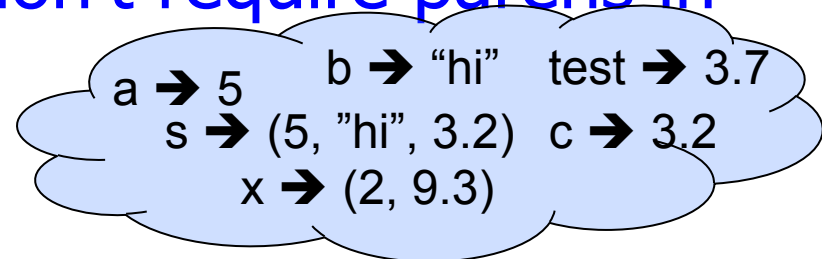

```
val b : string = "hi"
```

```
val c : float = 3.2
```

```
# let x = 2, 9.3;; (* tuples don't require parens in  
                  Ocaml *)
```

```
val x : int * float = (2, 9.3)
```

Nested Tuples

```
# (*Tuples can be nested *)
```

```
let d = ((1,4,62),("bye",15),73.95);;
```

```
val d : (int * int * int) * (string * int) * float =  
  ((1, 4, 62), ("bye", 15), 73.95)
```

```
# (*Patterns can be nested *)
```

```
let (p,(st,_),_) = d;; (* _ matches all, binds nothing  
*)
```

```
val p : int * int * int = (1, 4, 62)
```

```
val st : string = "bye"
```

Functions on tuples

```
# let plus_pair (n,m) = n + m;;
```

```
val plus_pair : int * int -> int = <fun>
```

```
# plus_pair (3,4);;
```

```
- : int = 7
```

```
# let double x = (x,x);;
```

```
val double : 'a -> 'a * 'a = <fun>
```

```
# double 3;;
```

```
- : int * int = (3, 3)
```

```
# double "hi";;
```

```
- : string * string = ("hi", "hi")
```

Functions on tuples

```
# let plus_pair (n,m) = n + m;;
```

```
val plus_pair : int * int -> int = <fun>
```

```
# plus_pair (3,4);;
```

```
- : int = 7
```

```
# let double x = (x,x);;
```

```
val double : 'a -> 'a * 'a = <fun>
```

```
# double 3;;
```

```
- : int * int = (3, 3)
```

```
# double "hi";;
```

```
- : string * string = ("hi", "hi")
```

Save the Environment!

- A *closure* is a pair of an environment and an association of a pattern (e.g. (v_1, \dots, v_n) giving the input variables) with an expression (the function body), written:

$$\langle (v_1, \dots, v_n) \rightarrow \text{exp}, \rho \rangle$$

- Where ρ is the environment in effect when the function is defined (for a simple function)

Closure for plus_x

- When plus_x was defined, had environment:

$$\rho_{\text{plus_x}} = \{\dots, x \rightarrow 12, \dots\}$$

- Recall: let plus_x y = y + x

is really let plus_x = fun y -> y + x

- Closure for fun y -> y + x:

$$\langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle$$

- Environment just after plus_x defined:

$$\{\text{plus_x} \rightarrow \langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle\} + \rho_{\text{plus_x}}$$

Recall: `let plus_x = fun x => y + x`

`let x = 12`

`x → 12`

...

`let plus_x = fun y => y + x`

`x → 12`

...

`plus_x →`

`y → y + x`

`x → 12`

...

`let x = 7`

`plus_x →`

`y → y + x`

`x → 12`

...

...

`x → 7`

Closure for plus_pair

- Assume $\rho_{\text{plus_pair}}$ was the environment just before `plus_pair` defined

- Closure for `fun (n,m) -> n + m`:

$$\langle (n,m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle$$

- Environment just after `plus_pair` defined:

$$\{\text{plus_pair} \rightarrow \langle (n,m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle\} \\ + \rho_{\text{plus_pair}}$$

Functions with more than one argument

```
# let add_three x y z = x + y + z;;
```

```
val add_three : int -> int -> int -> int = <fun>
```

```
# let t = add_three 6 3 2;;
```

```
val t : int = 11
```

```
# let add_three =
```

```
  fun x -> (fun y -> (fun z -> x + y + z));;
```

```
val add_three : int -> int -> int -> int = <fun>
```

Again, first syntactic sugar for second

Curried vs Uncurried

- Recall

```
val add_three : int -> int -> int -> int = <fun>
```

- How does it differ from

```
# let add_triple (u,v,w) = u + v + w;;
```

```
val add_triple : int * int * int -> int = <fun>
```

- add_three is *curried*;
- add_triple is *uncurried*

Curried vs Uncurried

```
# add_triple (6,3,2);;
```

```
- : int = 11
```

```
# add_triple 5 4;;
```

Characters 0-10:

```
add_triple 5 4;;
```

```
^^^^^^^^^^
```

This function is applied to too many arguments,
maybe you forgot a `;'

```
# fun x -> add_triple (5,4,x);;
```

```
: int -> int = <fun>
```

Partial application of functions

```
let add_three x y z = x + y + z;;
```

```
# let h = add_three 5 4;;
```

```
val h : int -> int = <fun>
```

```
# h 3;;
```

```
- : int = 12
```

```
# h 7;;
```

```
- : int = 16
```

```
- Partial application also called sectioning
```

Functions with more than one argument

```
# let add_three x y z = x + y + z;;
```

```
val add_three : int -> int -> int -> int = <fun>
```

- What is the value of `add_three`?
- Let $\rho_{\text{add_three}}$ be the environment before the declaration
- Remember:

```
let add_three =
```

```
  fun x -> (fun y -> (fun z -> x + y + z));;
```

```
Value: <x ->fun y -> (fun z -> x + y + z),  $\rho_{\text{add\_three}}$  >
```

Match Expressions

```
# let triple_to_pair triple =
```

```
  match triple
```

```
  with (0, x, y) -> (x, y)
```

```
  | (x, 0, y) -> (x, y)
```

```
  | (x, y, _) -> (x, y);;
```

- Each clause: pattern on left, expression on right
- Each x, y has scope of only its clause
- Use first matching clause

```
val triple_to_pair : int * int * int -> int * int =  
  <fun>
```

Recursive Functions

```
# let rec factorial n =  
    if n = 0 then 1 else n * factorial (n - 1);;  
val factorial : int -> int = <fun>  
# factorial 5;;  
- : int = 120  
# (* rec is needed for recursive function  
   declarations *)
```

Recursion Example

Compute n^2 recursively using:

$$n^2 = (2 * n - 1) + (n - 1)^2$$

```
# let rec nthsq n =      (* rec for recursion *)
  match n                (* pattern matching for cases *)
  with 0 -> 0            (* base case *)
  | n -> (2 * n - 1)     (* recursive case *)
      + nthsq (n - 1);; (* recursive call *)
val nthsq : int -> int = <fun>
# nthsq 3;;
- : int = 9
```

Structure of recursion similar to inductive proof

Recursion and Induction

```
# let rec nthsq n = match n with 0 -> 0  
  | n -> (2 * n - 1) + nthsq (n - 1) ;;
```

- Base case is the last case; it stops the computation
- Recursive call must be to arguments that are somehow smaller - must progress to base case
- **if** or **match** must contain base case
- Failure of these may cause failure of termination

Functions as arguments

```
# let thrice f x = f (f (f x));;
```

```
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

```
# let g = thrice plus_two;;
```

```
val g : int -> int = <fun>
```

```
# g 4;;
```

```
- : int = 10
```

```
# thrice (fun s -> "Hi! " ^ s) "Good-bye!";;
```

```
- : string = "Hi! Hi! Hi! Good-bye!"
```

Higher Order Functions

- A function is *higher-order* if it takes a function as an argument or returns one as a result
- Example:

```
# let compose f g = fun x -> f (g x);;
```

```
val compose : ('a -> 'b) -> ('c -> 'a) -> 'c -> 'b = <fun>
```

- The type $('a \rightarrow 'b) \rightarrow ('c \rightarrow 'a) \rightarrow 'c \rightarrow 'b$ is a higher order type because of $('a \rightarrow 'b)$ and $('c \rightarrow 'a)$ and $\rightarrow 'c \rightarrow 'b$

Thrice

- Recall:

```
# let thrice f x = f (f (f x));;
```

```
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

- How do you write thrice with compose?

Thrice

- Recall:

```
# let thrice f x = f (f (f x));;
```

```
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

- How do you write thrice with compose?

```
# let thrice f = compose f (compose f f);;
```

```
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
```

- Is this the only way?

Lambda Lifting

- You must remember the rules for evaluation when you use partial application

```
# let add_two = (+) (print_string "test\n"; 2);;
```

```
test
```

```
val add_two : int -> int = <fun>
```

```
# let add2 = (* lambda lifted *)
```

```
  fun x -> (+) (print_string "test\n"; 2) x;;
```

```
val add2 : int -> int = <fun>
```

Lambda Lifting

```
# thrice add_two 5;;
```

```
- : int = 11
```

```
# thrice add2 5;;
```

```
test
```

```
test
```

```
test
```

```
- : int = 11
```

- Lambda lifting delayed the evaluation of the argument to (+) until the second argument was supplied

Partial Application and “Unknown Types”

- Recall `compose plus_two`:

```
# let f1 = compose plus_two;;
```

```
val f1 : ('_a -> int) -> '_a -> int = <fun>
```

- Compare to lambda lifted version:

```
# let f2 = fun g -> compose plus_two g;;
```

```
val f2 : ('a -> int) -> 'a -> int = <fun>
```

- What is the difference?

Partial Application and “Unknown Types”

- ‘_a can only be instantiated once for an expression

```
# f1 plus_two;;
```

```
- : int -> int = <fun>
```

```
# f1 List.length;;
```

Characters 3-14:

```
f1 List.length;;
```

```
^^^^^^^^^^^^
```

This expression has type 'a list -> int but is here used with type int -> int

Partial Application and “Unknown Types”

- ‘a can be repeatedly instantiated

```
# f2 plus_two;;
```

```
- : int -> int = <fun>
```

```
# f2 List.length;;
```

```
- : 'a list -> int = <fun>
```

Evaluating declarations

- Evaluation uses an environment ρ
- To evaluate a (simple) declaration $\text{let } x = e$
 - Evaluate expression e in ρ to value v
 - Update ρ with $x \ v$: $\{x \rightarrow v\} + \rho$
- Update: $\rho_1 + \rho_2$ has all the bindings in ρ_1 and all those in ρ_2 that are not rebound in ρ_1
 $\{x \rightarrow 2, y \rightarrow 3, a \rightarrow \text{"hi"}\} + \{y \rightarrow 100, b \rightarrow 6\}$
 $= \{x \rightarrow 2, y \rightarrow 3, a \rightarrow \text{"hi"}, b \rightarrow 6\}$

Evaluating expressions

- Evaluation uses an environment ρ
- A constant evaluates to itself
- To evaluate an variable, look it up in ρ : $\rho(v)$
- To evaluate uses of $+$, $-$, etc, eval args, then do operation
- Function expression evaluates to its closure
- To evaluate a local dec: $\text{let } x = e1 \text{ in } e2$
 - Eval $e1$ to v , eval $e2$ using $\{x \rightarrow v\} + \rho$

Evaluating conditions expressions

- To evaluate a conditional expression:
if b then e1 else e2
 - Evaluate **b** to a value **v**
 - If **v** is **True**, evaluate **e1**
 - If **v** is **False**, evaluate **e2**

Evaluation of Application with Closures

- Given application expression $f(e_1, \dots, e_n)$
- Evaluate (e_1, \dots, e_n) to value (v_1, \dots, v_n)
- In environment ρ , evaluate left term to closure,
 $c = \langle (x_1, \dots, x_n) \rightarrow b, \rho' \rangle$
 - (x_1, \dots, x_n) variables in (first) argument
- Update the environment ρ' to
 $\rho'' = \{x_1 \rightarrow v_1, \dots, x_n \rightarrow v_n\} + \rho'$
- Evaluate body b in environment ρ''

Evaluation of Application of plus_x;;

- Have environment:

$$\rho = \{\text{plus_x} \rightarrow \langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle, \dots, \\ y \rightarrow 3, \dots\}$$

where $\rho_{\text{plus_x}} = \{x \rightarrow 12, \dots, y \rightarrow 24, \dots\}$

- Eval (plus_x y, ρ) rewrites to
- App (Eval(plus_x, ρ) , Eval(y, ρ)) rewrites to
- App (Eval(plus_x, ρ) , 3) rewrites to
- App ($\langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle$, 3) rewrites to
- ...

Evaluation of Application of plus_x;;

- Have environment:

$$\rho = \{\text{plus_x} \rightarrow \langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle, \dots, \\ y \rightarrow 3, \dots\}$$

where $\rho_{\text{plus_x}} = \{x \rightarrow 12, \dots, y \rightarrow 24, \dots\}$

- $\text{App} (\langle y \rightarrow y + x, \rho_{\text{plus_x}} \rangle, 3)$ rewrites to
- $\text{Eval} (y + x, \{y \rightarrow 3\} + \rho_{\text{plus_x}})$ rewrites to
- $\text{Eval} (y, \{y \rightarrow 3\} + \rho_{\text{plus_x}}) +$
 $\text{Eval} (x, \{y \rightarrow 3\} + \rho_{\text{plus_x}})$ rewrites to
- $\text{Eval} (y, \{y \rightarrow 3\} + \rho_{\text{plus_x}}) + 12$ rewrites to
- $3 + 12 = 15$

Evaluation of Application of plus_pair

- Assume environment

$$\rho = \{x \rightarrow 3, \dots, \text{plus_pair} \rightarrow \langle (n, m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle\} + \rho_{\text{plus_pair}}$$

- $\text{Eval}(\text{plus_pair}(4, x), \rho) =$
- $\text{App}(\text{Eval}(\text{plus_pair}, \rho), \text{Eval}((4, x), \rho)) =$
- $\text{App}(\langle (n, m) \rightarrow n + m, \rho_{\text{plus_pair}} \rangle, (4, 3)) =$
- $\text{Eval}(n + m, \{n \rightarrow 4, m \rightarrow 3\} + \rho_{\text{plus_pair}}) =$
- $\text{Eval}(4 + 3, \{n \rightarrow 4, m \rightarrow 3\} + \rho_{\text{plus_pair}}) = 7$

Closure question

- If we start in an empty environment, and we execute:

```
let f = fun n -> n + 5;;
```

```
(* 0 *)
```

```
let pair_map g (n,m) = (g n, g m);;
```

```
let f = pair_map f;;
```

```
let a = f (4,6);;
```

What is the environment at `(* 0 *)`?

Answer

```
let f = fun n -> n + 5;;
```

$$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

Closure question

- If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
```

```
let pair_map g (n,m) = (g n, g m);;
```

```
(* 1 *)
```

```
let f = pair_map f;;
```

```
let a = f (4,6);;
```

What is the environment at `(* 1 *)`?

Answer

$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$

let pair_map g (n,m) = (g n, g m);;

$\rho_1 = \{\text{pair_map} \rightarrow$
 $\langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, g \ m),$
 $\{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\} \rangle,$
 $f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$

Closure question

- If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
```

```
let pair_map g (n,m) = (g n, g m);;
```

```
let f = pair_map f;;
```

```
(* 2 *)
```

```
let a = f (4,6);;
```

What is the environment at `(* 2 *)`?

Evaluate pair_map f

$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$

$\rho_1 = \{\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n, m) \rightarrow (g \ n, g \ m), \rho_0 \rangle,$
 $f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$

let f = pair_map f;;

Evaluate pair_map f

$$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

$$\rho_1 = \{\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n, m) \rightarrow (g \ n, g \ m), \rho_0 \rangle, \\ f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

$$\text{Eval}(\text{pair_map } f, \rho_1) =$$

Evaluate pair_map f

$$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

$$\rho_1 = \{\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n, m) \rightarrow (g \ n, g \ m), \rho_0 \rangle, \\ f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

$$\text{Eval}(\text{pair_map } f, \rho_1) =$$

$$\text{App } (\langle g \rightarrow \text{fun } (n, m) \rightarrow (g \ n, g \ m), \rho_0 \rangle, \\ \langle n \rightarrow n + 5, \{ \} \rangle) =$$

Evaluate pair_map f

$$\rho_0 = \{f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

$$\rho_1 = \{\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, g \ m), \rho_0 \rangle, \\ f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

$$\text{Eval}(\text{pair_map } f, \rho_1) =$$

$$\text{App } (\langle g \rightarrow \text{fun } (n,m) \rightarrow (g \ n, g \ m), \rho_0 \rangle, \\ \langle n \rightarrow n + 5, \{ \} \rangle) =$$

$$\text{Eval}(\text{fun } (n,m) \rightarrow (g \ n, g \ m), \{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\} + \rho_0)$$

$$= \langle (n,m) \rightarrow (g \ n, g \ m), \{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\} + \rho_0 \rangle$$

$$= \langle (n,m) \rightarrow (g \ n, g \ m), \{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \\ f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle\}$$

Answer

$\rho_1 = \{\text{pair_map} \rightarrow$
 $\langle g \rightarrow \text{fun } (n,m) \rightarrow (g\ n, g\ m), \{f \rightarrow \langle n \rightarrow n + 5, \{\}\rangle\}\rangle,$
 $f \rightarrow \langle n \rightarrow n + 5, \{\}\rangle\}$

let f = pair_map f;;

$\rho_2 = \{f \rightarrow \langle (n,m) \rightarrow (g\ n, g\ m),$
 $\{g \rightarrow \langle n \rightarrow n + 5, \{\}\rangle,$
 $f \rightarrow \langle n \rightarrow n + 5, \{\}\rangle\}\rangle,$
 $\text{pair_map} \rightarrow \langle g \rightarrow \text{fun } (n,m) \rightarrow (g\ n, g\ m),$
 $\{f \rightarrow \langle n \rightarrow n + 5, \{\}\rangle\}\rangle\}$

Closure question

- If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
```

```
let pair_map g (n,m) = (g n, g m);;
```

```
let f = pair_map f;;
```

```
let a = f (4,6);;
```

```
(* 3 *)
```

What is the environment at `(* 3 *)`?

Final Evaluation?

```
ρ2 = {f → <(n,m) →(g n, g m),  
      {g → <n → n + 5, { }>,  
      f → <n → n + 5, { }>}}>,  
pair_map → <g → fun (n,m) -> (g n, g m),  
           {f → <n → n + 5, { }>}}>
```

```
let a = f (4,6);;
```

Evaluate $f(4,6)$;;

$$\rho_2 = \{f \rightarrow \langle (n,m) \rightarrow (g\ n, g\ m),$$
$$\quad \{g \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle,$$
$$\quad f \rightarrow \langle n \rightarrow n + 5, \{ \} \rangle \rangle\},$$
