Programming Languages and Compilers (CS 421)

Elsa L Gunter 2112 SC, UIUC

http://courses.engr.illinois.edu/cs421

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

Continuations

- A programming technique for all forms of "non-local" control flow:
 - non-local jumps
 - exceptions
 - general conversion of non-tail calls to tail calls
- Essentially it's a higher-order function version of GOTO

Continuations

- Idea: Use functions to represent the control flow of a program
- Method: Each procedure takes a function as an extra argument to which to pass its result; outer procedure "returns" no result
- Function receiving the result called a continuation
- Continuation acts as "accumulator" for work still to be done

Continuation Passing Style

 Writing procedures such that all procedure calls take a continuation to which to give (pass) the result, and return no result, is called continuation passing style (CPS)

Continuation Passing Style

- A compilation technique to implement nonlocal control flow, especially useful in interpreters.
- A formalization of non-local control flow in denotational semantics
- Possible intermediate state in compiling functional code

Why CPS?

- Makes order of evaluation explicitly clear
- Allocates variables (to become registers) for each step of computation
- Essentially converts functional programs into imperative ones
 - Major step for compiling to assembly or byte code
- Tail recursion easily identified
- Strict forward recursion converted to tail recursion
 - At the expense of building large closures in heap

Other Uses for Continuations

- CPS designed to preserve order of evaluation
- Continuations used to express order of evaluation
- Can be used to change order of evaluation
- Implements:
 - Exceptions and exception handling
 - Co-routines
 - (pseudo, aka green) threads

Example

Simple reporting continuation:

let report x = (print_int x; print_newline());;
val report : int -> unit = <fun>

Simple function using a continuation:
let addk (a, b) k = k (a + b);;
val addk : int * int -> (int -> 'a) -> 'a = <fun>
addk (22, 20) report;;

- : unit = ()

Simple Functions Taking Continuations

- Given a primitive operation, can convert it to pass its result forward to a continuation
- Examples:

let subk (x, y) k = k(x - y);; val subk : int * int -> (int -> 'a) -> 'a = <fun> # let eqk (x, y) k = k(x = y);; val eqk : 'a * 'a -> (bool -> 'b) -> 'b = <fun> # let timesk (x, y) k = k(x * y);; val timesk : int * int -> (int -> 'a) -> 'a = <fun>

Nesting Continuations

let add_triple (x, y, z) = (x + y) + z;;val add_triple : int * int * int -> int = <fun> # let add_triple (x,y,z)=let p = x + y in p + z; val add_triple : int * int * int -> int = <fun> # let add_triple_k (x, y, z) k = addk (x, y) (fun p -> addk (p, z) \mathbb{K}); val add_triple_k: int * int * int -> (int -> 'a) -> $a = \langle fun \rangle$

add_three: a different order

- # let add_triple (x, y, z) = x + (y + z);;
- How do we write add_triple_k to use a different order?
- let add_triple_k (x, y, z) k =

add_three: a different order

- # let add_triple (x, y, z) = x + (y + z);;
- How do we write add_triple_k to use a different order?
- let add_triple_k (x, y, z) k = addk (y,z) (fun r -> addk(x,r) k)

Recall:

let rec factorial n =
 if n = 0 then 1 else n * factorial (n - 1);;
 val factorial : int -> int = <fun>
factorial 5;;
- : int = 120

let rec factorial n =let b = (n = 0) in (* First computation *) if b then 1 (* Returned value *) else let s = n - 1 in (* Second computation *) let r = factorial s in (* Third computation *) n * r (* Returned value *) ;; val factorial : int -> int = < fun ># factorial 5;; -: int = 120

let rec factorialk n k = eqk (n, 0) (fun b -> (* First computation *) if b then k 1 (* Passed value *) else subk (n, 1) (* Second computation *) (fun s -> factorialk s (* Third computation *) (fun r -> timesk (n, r) k))) (* Passed value *) val factorialk : int -> (int -> 'a) -> 'a = <fun> # factorialk 5 report;; 120

- To make recursive call, must build intermediate continuation to
 - take recursive value: r
 - build it to final result: n * r
 - And pass it to final continuation:
 - times (n, r) k = k (n * r)

#let rec length list = match list with [] -> 0|(a :: bs) -> let r1 = length bs in 1 + r1What is the CSP version of this? #let rec lengthk list k = match list with [] -> k 0 $| x :: xs \rightarrow \text{lengthk xs (fun r } \rightarrow \text{addk (r,1) k)};$ val lengthk : 'a list -> (int -> 'b) -> 'b = $\langle fun \rangle$ # lengthk [2;4;6;8] report;;

4

- : unit = ()

CPS for Higher Order Functions

- In CPS, every procedure / function takes a continuation to receive its result
- Procedures passed as arguments take continuations
- Procedures returned as results take continuations
- CPS version of higher-order functions must expect input procedures to take continuations

#let rec all (p, l) = match l with [] -> true
 | (x :: xs) -> let b = p x in
 if b then all (p, xs) else false
val all : ('a -> bool) -> 'a list -> bool = <fun>
 What is the CPS version of this?
#let rec allk (pk, l) k =

#let rec all (p, l) = match l with [] -> true
 | (x :: xs) -> let b = p x in
 if b then all (p, xs) else false
val all : ('a -> bool) -> 'a list -> bool = <fun>
 What is the CPS version of this?
#let rec allk (pk, l) k = match l with [] -> k true

#let rec all (p, l) = match I with [] -> true
 | (x :: xs) -> let b = p x in
 if b then all (p, xs) else false
val all : ('a -> bool) -> 'a list -> bool = <fun>
 What is the CPS version of this?
#let rec allk (pk, l) k = match I with [] -> k true
 | (x :: xs) ->

#let rec all (p, l) = match l with [] -> true | (x :: xs) -> let b = p x in if b then all (p, xs) else false val all : ('a -> bool) -> 'a list -> bool = <fun> What is the CPS version of this? #let rec allk (pk, l) k = match l with [] -> k true | (x :: xs) -> pk x

#let rec all (p, I) = match I with [] -> true|(x :: xs) -> let b = p x inif b then all (p, xs) else false val all : ('a -> bool) -> 'a list -> bool = <fun> What is the CPS version of this? #let rec allk (pk, I) k = match I with [] -> k true | (x :: xs) -> pk x (fun b -> if b then else

#let rec all (p, I) = match I with [] -> true|(x :: xs) -> let b = p x inif b then all (p, xs) else false val all : ('a -> bool) -> 'a list -> bool = <fun> What is the CPS version of this? #let rec allk (pk, I) k = match I with [] -> k true | (x :: xs) -> pk x (fun b -> if b then allk (pk, xs) k else k false) val allk : ('a -> (bool -> 'b) -> 'b) * 'a list -> (bool -> 'b) -> 'b = <fun>

let rec sum list = match list with $[] \rightarrow 0$ | x :: xs -> x + sum xs ;; val sum : int list -> int = <fun> # let rec sum list = match list with [] -> 0| x :: xs -> let r1 = sum xs in x + r1;;val sum : int list -> int = < fun ># let rec sumk list k = match list with [] -> k 0| x :: xs -> sumk xs (fun r1 -> addk (x, r1) k);;val sumk : int list \rightarrow (int \rightarrow 'a) \rightarrow 'a = <fun> # sumk [2;4;6;8] report;; 20

$$-: unit = ()$$

Terms

- A function is in Direct Style when it returns its result back to the caller.
- A Tail Call occurs when a function returns the result of another function call without any more computations (eg tail recursion)
- A function is in Continuation Passing Style when it, and every function call in it, passes its result to another function.
- Instead of returning the result to the caller, we pass it forward to another function.

Terminology

- Tail Position: A subexpression s of expressions e, such that if evaluated, will be taken as the value of e
 - if (x>3) then x + 2 else x 4
 let x = 5 in x + 4
- Tail Call: A function call that occurs in tail position
 - if (h x) then f x else $(x \pm g x)$

Terminology

- Available: A function call that can be executed by the current expression
- The fastest way to be unavailable is to be guarded by an abstraction (anonymous function, lambda lifted).
 - if (h x) then f x else (x + g x)
 - if (h x) then (fun x -> f x) else (g(x + x))

Not available

CPS Transformation

- Step 1: Add continuation argument to any function definition:
 - let f arg = e \Rightarrow let f arg k = e
 - Idea: Every function takes an extra parameter saying where the result goes
- Step 2: A simple expression in tail position should be passed to a continuation instead of returned:
 - return $a \Rightarrow k a$
 - Assuming a is a constant or variable.
 - "Simple" = "No available function calls."

CPS Transformation

- Step 3: Pass the current continuation to every function call in tail position
 - return f arg \Rightarrow f arg k
 - The function "isn't going to return," so we need to tell it where to put the result.

CPS Transformation

- Step 4: Each function call not in tail position needs to be converted to take a new continuation (containing the old continuation as appropriate)
 - return op (f arg) \Rightarrow f arg (fun r -> k(op r))
 - op represents a primitive operation
 - return $f(g arg) \Rightarrow g arg (fun r-> f r k)$

Example

Before:

let rec add_list lst = match lst with

```
[]-> 0
| 0 :: xs -> add_list xs
| x :: xs -> (+) x
   (add_list xs);;
```

After:

Other Uses for Continuations

- CPS designed to preserve order of evaluation
- Continuations used to express order of evaluation
- Can be used to change order of evaluation
- Implements:
 - Exceptions and exception handling
 - Co-routines
 - (pseudo, aka green) threads

Exceptions - Example

```
# exception Zero;;
exception Zero
# let rec list_mult_aux list =
   match list with [] -> 1
   X :: XS ->
   if x = 0 then raise Zero
            else x * list_mult_aux xs;;
val list mult aux : int list -> int = <fun>
```

Exceptions - Example

let list_mult list =

try list_mult_aux list with Zero -> 0;;
val list_mult : int list -> int = <fun>
list_mult [3;4;2];;

- -: int = 24
- # list_mult [7;4;0];;
- -: int = 0
- # list_mult_aux [7;4;0];;
 Exception: Zero.

Exceptions

- When an exception is raised
 - The current computation is aborted
 - Control is "thrown" back up the call stack until a matching handler is found
 - All the intermediate calls waiting for a return values are thrown away

Implementing Exceptions

let multkp (m, n) k =let r = m * n in(print_string "product result: "; print_int r; print_string "\n"; k r);; val multkp : int (int -> (int -> 'a) -> 'a = <fun>

Implementing Exceptions

let rec list_multk_aux list k kexcp = match list with $[] \rightarrow k 1$ $| x :: xs \rightarrow if x = 0$ then kexcp 0 else list_multk_aux xs (fun r -> multkp (x, r) k) kexcp;; val list multk aux : int list -> (int -> 'a) -> (int -> 'a) -> 'a = <fun> # let rec list_multk list k = list_multk_aux list k k;;

val list_multk : int list -> (int -> 'a) -> 'a = <fun>

Implementing Exceptions

```
# list_multk [3;4;2] report;;
product result: 2
product result: 8
product result: 24
24
-: unit = ()
# list_multk [7;4;0] report;;
\bigcap
```

```
- : unit = ()
```
