Programming Languages and Compilers (CS 421)

Elsa L Gunter
2112 SC, UIUC

https://courses.engr.illinois.edu/cs421/fa2017/CS421D

Based in part on slides by Mattox Beckman, as updated by Vikram Adve and Gul Agha

Functions with more than one argument

```
# let add_three x y z = x + y + z;;
val add_three : int -> int -> int -> int = <fun>
# let t = add_three 6 3 2;;
val t : int = 11
# let add_three =
   fun x -> (fun y -> (fun z -> x + y + z));;
val add_three : int -> int -> int -> int = <fun>
```

Again, first syntactic sugar for second

Functions with more than one argument

```
# let add_three x y z = x + y + z;;
val add_three : int -> int -> int -> int = <fun>
```

- What is the value of add_three?
- Let ρ_{add_three} be the environment before the declaration
- Remember:

```
let add_three =
 fun x -> (fun y -> (fun z -> x + y + z));;
```

Value: <x ->fun y -> (fun z -> x + y + z), ρ_{add_three} >

Partial application of functions

```
let add_three x y z = x + y + z;;
```

```
# let h = add_three 5 4;;
val h : int -> int = <fun>
# h 3;;
- : int = 12
# h 7;;
- : int = 16
```

Partial application of functions

```
let add_three x y z = x + y + z;;
```

```
# let h = add_three 5 4;;
val h : int -> int = <fun>
# h 3;;
- : int = 12
# h 7;;
- : int = 16
```

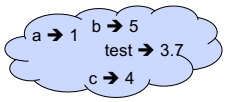
- Partial application also called *sectioning*

Functions as arguments

```
# let thrice f x = f (f (f x));;
val thrice : ('a -> 'a) -> 'a -> 'a = <fun>
# let g = thrice plus_two;;
val g : int -> int = <fun>
# g 4;;
- : int = 10
# thrice (fun s -> "Hi! " ^ s) "Good-bye!";;
- : string = "Hi! Hi! Hi! Good-bye!"
```

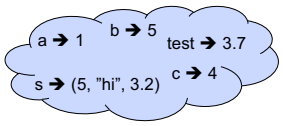
Tuples as Values

// ρ_7 = {c → 4, test → 3.7,
a → 1, b → 5}



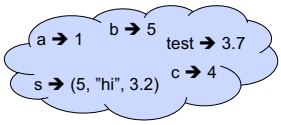
```
# let s = (5,"hi",3.2);;
val s : int * string * float = (5, "hi", 3.2)
```

// ρ_8 = {s → (5, "hi", 3.2),
c → 4, test → 3.7,
a → 1, b → 5}

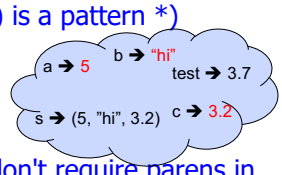


Pattern Matching with Tuples

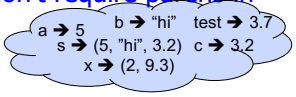
/ ρ_8 = {s → (5, "hi", 3.2),
c → 4, test → 3.7,
a → 1, b → 5}



```
# let (a,b,c) = s;;  (* (a,b,c) is a pattern *)
val a : int = 5
val b : string = "hi"
val c : float = 3.2
```



```
# let x = 2, 9.3;; (* tuples don't require parens in
  Ocaml *)
val x : int * float = (2, 9.3)
```



Nested Tuples

```
#  (*Tuples can be nested *)
let d = ((1,4,62),("bye",15),73.95);;
val d : (int * int * int) * (string * int) * float =
  ((1, 4, 62), ("bye", 15), 73.95)
#  (*Patterns can be nested *)
let (p,(st,_),_) = d;; (* _ matches all, binds nothing
   *)
val p : int * int * int = (1, 4, 62)
val st : string = "bye"
```

Functions on tuples

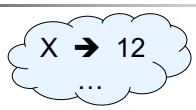
```
# let plus_pair (n,m) = n + m;;
val plus_pair : int * int -> int = <fun>
# plus_pair (3,4);;
- : int = 7
# let double x = (x,x);;
val double : 'a -> 'a * 'a = <fun>
# double 3;;
- : int * int = (3, 3)
# double "hi";;
- : string * string = ("hi", "hi")
```

Functions on tuples

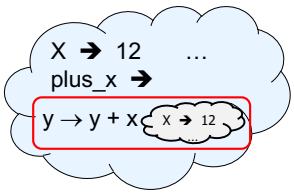
```
# let plus_pair (n,m) = n + m;;
val plus_pair : int * int -> int = <fun>
# plus_pair (3,4);;
- : int = 7
# let double x = (x,x);;
val double : 'a -> 'a * 'a = <fun>
# double 3;;
- : int * int = (3, 3)
# double "hi";;
- : string * string = ("hi", "hi")
```

Recall: let plus_x = fun x -> y + x

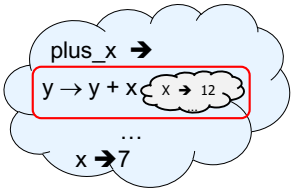
let x = 12



let plus_x = fun y -> y + x



let x = 7



Closure for plus_x

- When plus_x was defined, had environment:

$$\rho_{plus\_x} = \{\ldots, x \rightarrow 12, \ldots\}$$

- Recall: let plus_x y = y + x

  is really let plus_x = fun y -> y + x
- Closure for fun y -> y + x:

$$<y \rightarrow y + x, \rho_{plus\_x}>$$

- Environment just after plus_x defined:

$$\{plus\_x \rightarrow <y \rightarrow y + x, \rho_{plus\_x}>\} + \rho_{plus\_x}$$

Save the Environment!

- A *closure* is a pair of an environment and an association of a pattern (e.g. (v1,…,vn) giving the input variables) with an expression (the function body), written:

$$< (v1,\ldots,vn) \rightarrow exp, \rho >$$

- Where ρ is the environment in effect when the function is defined (for a simple function)

Closure for plus_pair

- Assume ρ_{plus_pair} was the environment just before plus_pair defined
- Closure for fun (n,m) -> n + m:

$$<(n,m) \rightarrow n + m, \rho_{plus\_pair}>$$

- Environment just after plus_pair defined:

$$\{plus\_pair \rightarrow <(n,m) \rightarrow n + m, \rho_{plus\_pair}>\} + \rho_{plus\_pair}$$

Curried vs Uncurried

- Recall

```
val add_three : int -> int -> int -> int = <fun>
```

- How does it differ from

```
# let add_triple (u,v,w) = u + v + w;;
val add_triple : int * int * int -> int = <fun>
```

- add_three is *curried*;
- add_triple is *uncurried*

Curried vs Uncurried

```
# add_triple (6,3,2);;
- : int = 11
# add_triple 5 4;;
Characters 0-10:
  add_triple 5 4;;
  ^^^^^^^^^^
This function is applied to too many arguments,
maybe you forgot a `;'
# fun x -> add_triple (5,4,x);;
: int -> int = <fun>
```

Match Expressions

```
# let triple_to_pair triple =
  match triple
  with (0, x, y) -> (x, y)
  | (x, 0, y) -> (x, y)
  | (x, y, _) -> (x, y);;
val triple_to_pair : int * int * int -> int * int =
  <fun>
```

- Each clause: pattern on left, expression on right
- Each x, y has scope of only its clause
- Use first matching clause

Evaluating declarations

- Evaluation uses an environment ρ
- To evaluate a (simple) declaration let x = e
  - Evaluate expression e in ρ to value v
  - Update ρ with x v: $\{x \rightarrow v\} + \rho$
- Update: $\rho_1 + \rho_2$ has all the bindings in ρ_1 and all those in ρ_2 that are not rebound in ρ_1

$\{x \rightarrow 2, y \rightarrow 3, a \rightarrow$ "hi"$\} + \{y \rightarrow 100, b \rightarrow 6\}$
$= \{x \rightarrow 2, y \rightarrow 3, a \rightarrow$ "hi", $b \rightarrow 6\}$

Evaluating expressions in OCaml

- Evaluation uses an environment ρ
- A constant evaluates to itself, including primitive operators like + and =
- To evaluate a variable, look it up in ρ: $\rho(v)$
- To evaluate a tuple $(e_1,\ldots,e_n)$,
  - Evaluate each e_i to v_i, right to left for Ocaml
  - Then make value $(v_1,\ldots,v_n)$

Evaluating expressions in OCaml

- To evaluate uses of +, _ , etc, eval args, then do operation
- Function expression evaluates to its closure
- To evaluate a local dec: let x = e1 in e2
  - Eval e1 to v, then eval e2 using $\{x \rightarrow v\} + \rho$
- To evaluate a conditional expression: if b then e1 else e2
  - Evaluate b to a value v
  - If v is True, evaluate e1
  - If v is False, evaluate e2

Evaluation of Application with Closures

- Given application expression f e
- In Ocaml, evaluate e to value v
- In environment ρ, evaluate left term to closure, $c = <(x_1,\ldots,x_n) \rightarrow b, \rho'>$
  - $(x_1,\ldots,x_n)$ variables in (first) argument
  - v must have form $(v_1,\ldots,v_n)$
- Update the environment ρ' to

  $\rho'' = \{x_1 \rightarrow v_1,\ldots, x_n \rightarrow v_n\} + \rho'$
- Evaluate body b in environment ρ''

Evaluating expressions in OCaml

- Evaluation uses an environment ρ
  - Eval (e , ρ)
- A constant evaluates to itself, including primitive operators like + and =
  - Eval (c , ρ) => Val c
- To evaluate a variable v, look it up in ρ:
  - Eval (v, ρ) => Val (ρ(v))

Evaluating expressions in OCaml

- To evaluate a tuple $(e_1,\ldots,e_n)$,
  - Evaluate each e_i to v_i, right to left for Ocaml
  - Then make value $(v_1,\ldots,v_n)$
  - Eval($(e_1,\ldots,e_n),\rho$)=> Eval($(e_1,\ldots,$Eval (e_n, ρ)), ρ)
  - Eval($(e_1,\ldots,e_i,$ Val $v_{i+1},\ldots,$ Val $v_n)$, ρ) => Eval($(e_1,\ldots,$Eval(e_i, ρ), Val $v_{i+1},\ldots,$ Val $v_n)$, ρ)
  - Eval((Val $v_1,\ldots,$Val $v_n)$, ρ) => Val $(v_1,\ldots,v_n)$

Evaluating expressions in OCaml

- To evaluate uses of +, - , etc, eval args, then do operation ◉ (+, -, *, +., ….)
  - Eval(e_1◉e_2, ρ) => Eval(e_1◉Eval(e_2, ρ), ρ))
  - Eval(e_1◉Val e_2, ρ)=>Eval(Eval(e_1, ρ)◉Val v_2, ρ))
  - Eval(Val v_1◉ Val v_2) => Val (v_1◉ v_2)
- Function expression evaluates to its closure
  - Eval (fun x -> e, ρ) => Val < x -> e, ρ>

Evaluating expressions in OCaml

- To evaluate a local dec: let x = e1 in e2
  - Eval e1 to v, then eval e2 using {x → v} + ρ
  - Eval(let x = e_1 in e_2, ρ) =>
    Eval(let x = Eval(e_1, ρ) in e_2, ρ)
  - Eval(let x = Val v in e_2, ρ) =>
    Eval(e_2, {x → v} + ρ)

Evaluating expressions in OCaml

- To evaluate a conditional expression:
  if b then e_1 else e_2
  - Evaluate b to a value v
  - If v is True, evaluate e_1
  - If v is False, evaluate e_2
  - Eval(if b then e_1 else e_2, ρ) =>
    Eval(if Eval(b, ρ) then e_1 else e_2, ρ)
  - Eval(if Val true then e_1 else e_2, ρ) =>Eval(e_1, ρ)
  - Eval(if Val false then e_1 else e_2, ρ) =>Eval(e_2, ρ)

Evaluation of Application with Closures

- Given application expression f e
- In Ocaml, evaluate e to value v
- In environment ρ, evaluate left term to closure, c = <(x_1,…,x_n) → b, ρ'>
  - (x_1,…,x_n) variables in (first) argument
  - v must have form (v_1,…,v_n)
- Update the environment ρ' to
  ρ'' = {x_1 → v_1,…, x_n →v_n}+ ρ'
- Evaluate body b in environment ρ''

Evaluation of Application with Closures

- Eval(f e, ρ) => Eval(f (Eval(e, ρ)), ρ)
- Eval(f (Val v), ρ) =>Eval((Eval(f, ρ)) (Val v), ρ)
- Eval((Val <(x_1,…,x_n) → b, ρ'>)(Val (v_1,…,v_n)), ρ)=>
  Eval(b, {x_1 → v_1,…, x_n → v_n}+ρ')

Evaluation of Application of plus_x;;

- Have environment:
  ρ = {plus_x → <y → y + x, ρ_{plus_x} >, … ,
  y → 19, x →17, z →3, …}
  where ρ_{plus_x} = {x → 12, … , y → 24, …}
- Eval (plus_x z, ρ) =>
- Eval(plus_x (Eval(z, ρ))) => …

Evaluation of Application of plus_x;;

Closure question

- If we start in an empty environment, and we execute:

```
let f = fun n -> n + 5;;
(* 0 *)
let pair_map g (n,m) = (g n, g m);;
let f = pair_map f;;
let a = f (4,6);;
```

What is the environment at (* 0 *)?

Answer

```
let f = fun n -> n + 5;;
```

$\rho_0 = \{f \rightarrow <n \rightarrow n + 5, \{\}>\}$

Closure question

- If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
let pair_map g (n,m) = (g n, g m);;
(* 1 *)
let f = pair_map f;;
let a = f (4,6);;
```

What is the environment at (* 1 *)?

Answer

$\rho_0 = \{f \rightarrow <n \rightarrow n + 5, \{\}>\}$

```
let pair_map g (n,m) = (g n, g m);;
```

$\rho_1 = \{$pair_map $\rightarrow$
$<g \rightarrow$ fun (n,m) -> (g n, g m),
$\{f \rightarrow <n \rightarrow n + 5, \{\}>\}>$,
$f \rightarrow <n \rightarrow n + 5, \{\}>\}$

Closure question

- If we start in an empty environment, and we execute:

```
let f = fun => n + 5;;
let pair_map g (n,m) = (g n, g m);;
let f = pair_map f;;
(* 2 *)
let a = f (4,6);;
```

What is the environment at (* 2 *)?

Evaluate pair_map f

$\rho_0 = \{f \rightarrow <n \rightarrow n + 5, \{\}>\}$
$\rho_1 = \{$pair_map $\rightarrow <g \rightarrow$ fun (n,m) -> (g n, g m), $\rho_0>$,
$f \rightarrow <n \rightarrow n + 5, \{\}>\}$

```
let f = pair_map f;;
```

Evaluate pair_map f

ρ_0 = {f → <n → n + 5, { }>}
