Computer Science 425 Distributed Systems

CS 425 / CSE 424 / ECE 428

Fall 2012

Indranil Gupta (Indy) August 28, 2012

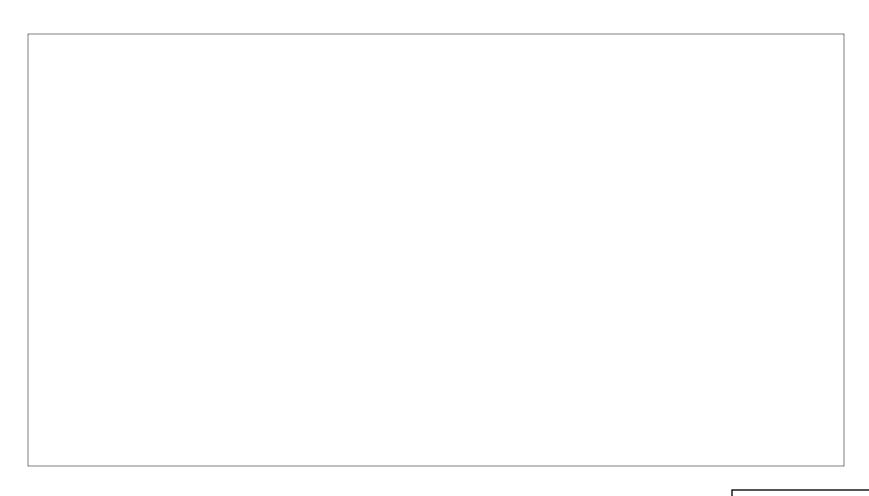

Lecture 1

Website: http://courses.engr.illinois.edu/cs425

Our Main Goal Today

To Define the Term Distributed System

Can you name some examples of Operating Systems?

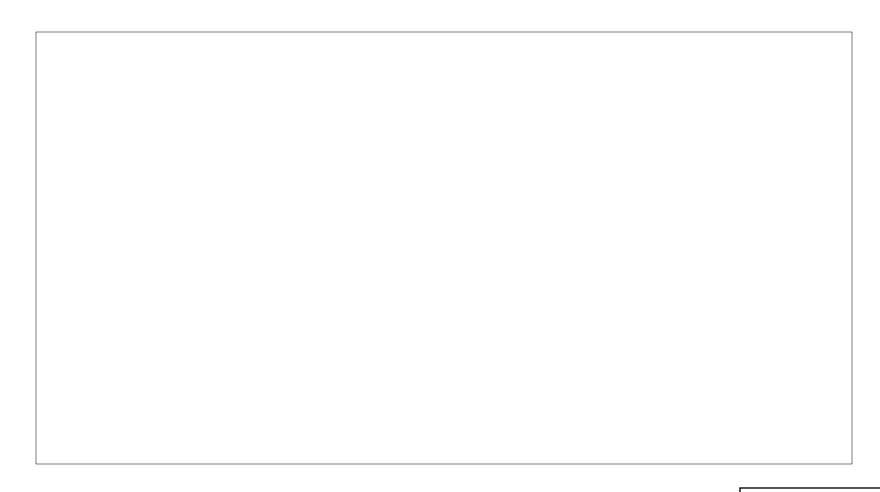

Can you name some examples of Operating Systems?

. . .

Linux Win8 Unix FreeBSD Mountain Lion 2K Aegis Scout Hydra Mach SPIN OS/2 Express Flux Hope Spring AntaresOS EOS LOS SQOS LittleOS TINOS iOS PalmOS WinCE TinyOS Android

- - -

What is an Operating System?

What is an Operating System?

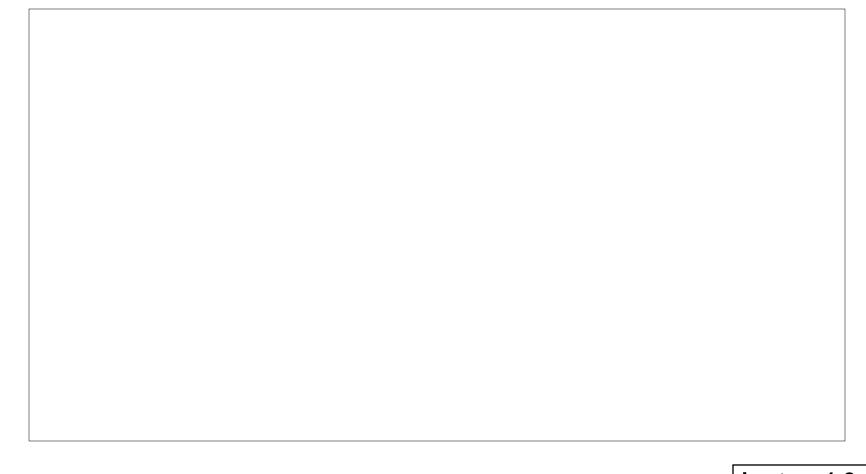

- User interface to hardware (device driver)
- Provides abstractions (processes, file system)
- Resource manager (scheduler)
- Means of communication (networking)
- •

FOLDOC definition

(FOLDOC = Free On-Line Dictionary of Computing)

Operating System - The low-level software which handles the interface to peripheral hardware, schedules tasks, allocates storage, and presents a default interface to the user when no application program is running.

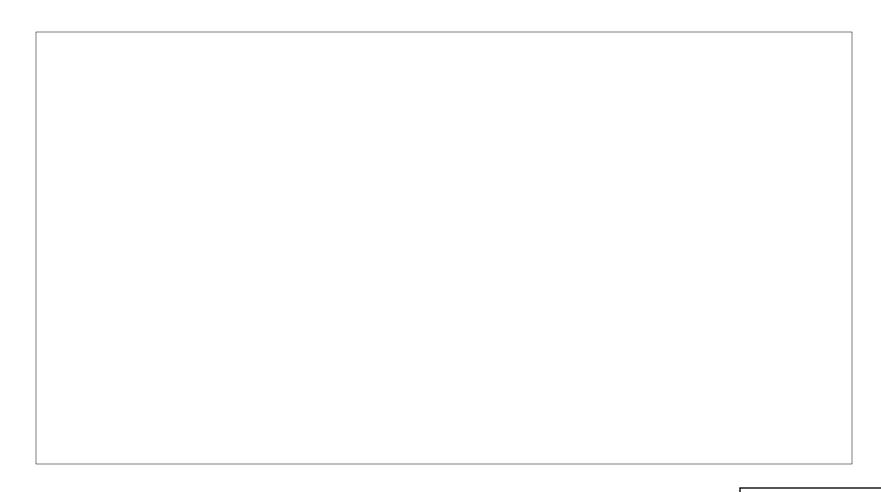

Can you name some examples of Distributed Systems?

Can you name some examples of Distributed Systems?

- Client-Server (NFS)
- The Web
- The Internet
- A wireless network
- DNS
- Gnutella or BitTorrent (peer to peer overlays)
- A "cloud", e.g., Amazon EC2/S3, Microsoft Azure
- A datacenter, e.g., NCSA, a Google datacenter, The Planet
- (Society?)

What is a Distributed System?

FOLDOC definition

A collection of (probably heterogeneous) automata whose distribution is transparent to the user so that the system appears as one local machine. This is in contrast to a network, where the user is aware that there are several machines, and their location, storage replication, load balancing and functionality is not transparent. Distributed systems usually use some kind of client-server organization.

Textbook definitions

- A distributed system is a collection of independent computers that appear to the users of the system as a single computer [Andrew Tanenbaum]
- A distributed system is several computers doing something together. Thus, a distributed system has three primary characteristics: multiple computers, interconnections, and shared state
 [Michael Schroeder]

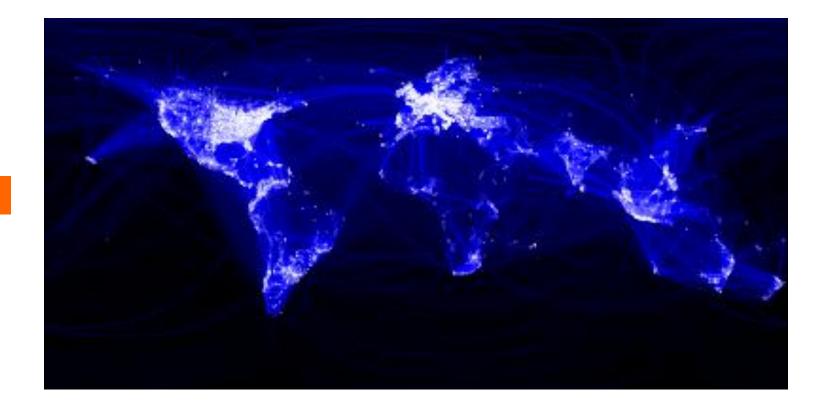

Unsatisfactory

- Why are these definitions short?
- Why do these definitions look inadequate to us?
- Because we are interested in the insides of a distributed system
 - design and implementation
 - Maintenance
 - Algorithmics ("protocols")

"I shall not today attempt further to define the kinds of material I understand to be embraced within that shorthand description; and perhaps I could never succeed in intelligibly doing so. But I know it when I see it, and the motion picture involved in this case is not that."

[Potter Stewart, Associate Justice, US Supreme Court (talking about his interpretation of a technical term laid down in the law, case Jacobellis versus Ohio 1964)]

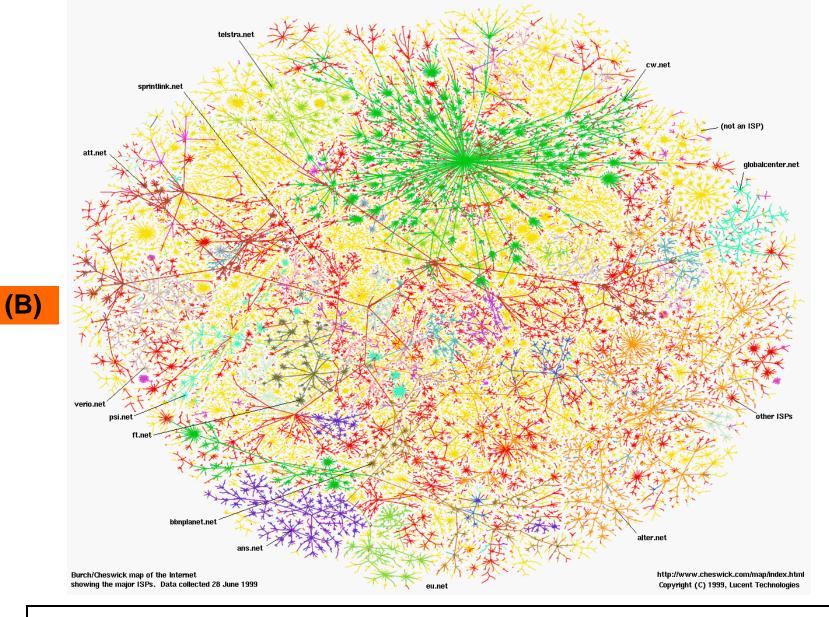

Which is a Distributed System – (A) or (B)?

(A) Facebook Social Network Graph among humans

Source: https://www.facebook.com/note.php?note_id=469716398919

(A)

(B) The Internet (Internet Mapping Project, color coded by ISPs)

A working definition for us

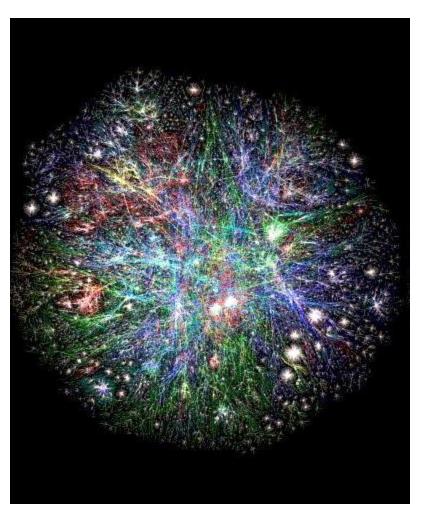

A distributed system is a collection of entities, each of which is autonomous, programmable, asynchronous and failure-prone, and which communicate through an unreliable communication medium.

- Entity=a process on a device (PC, PDA)
- Communication Medium=Wired or wireless network
- Our interest in distributed systems involves
 - design and implementation, maintenance, algorithmics

Distributed System Example – Web domains

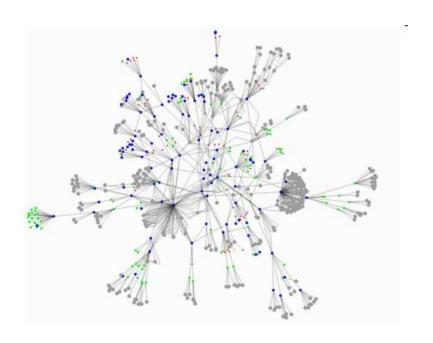

What are the "entities" (nodes)?

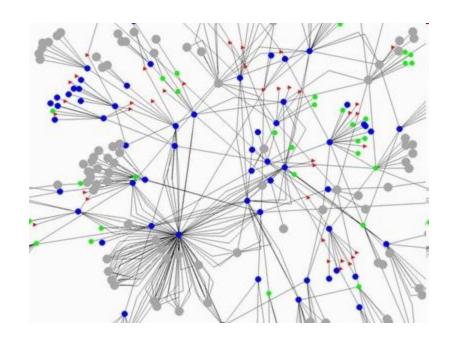

What is the communication medium (links)?

Source: http://www.vlib.us/web/worldwideweb3d.html

Distributed System Example – Gnutella Peer to Peer System

What are the "entities" (nodes)?

What is the communication medium (links)?

Source: GnuMap Project

Distributed System Example – A Datacenter

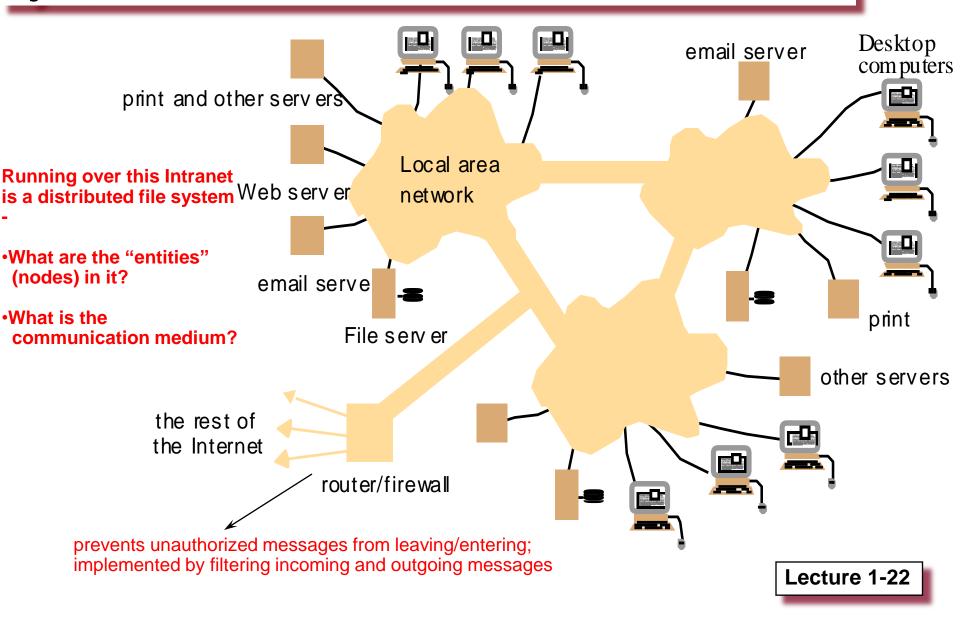

The Internet – Quick Refresher

- Underlies many distributed systems.
- A vast interconnected collection of computer networks of many types.
- Intranets subnetworks operated by companies and organizations.
- Intranets contain LANs and other subnets.
- WAN wide area networks, consists of LANs
- ISPs companies that provide modem links and other types of connections to users.
- Intranets are linked by backbones network links of large bandwidth, such as satellite connections, fiber optic cables, and other high-bandwidth circuits.
- UC2B? Google Fiber?

An Intranet underneath a distributed file system

Distributed Systems are layered over networks

Application layer protocol		Underlying transport protocol
<u> </u>		TCP
telnet [RFC 854]		TCP
http [RFC 2068]		TCP
ftp [RFC 959]		TCP
proprietary	П	TCP or UDP
(e.g. RealNetworks		
NFS		TCP or UDP
proprietary		typically UDP
(e.g., Skype)		
	smtp [RFC 821] telnet [RFC 854] http [RFC 2068] ftp [RFC 959] proprietary (e.g. RealNetworks NFS proprietary	smtp [RFC 821] telnet [RFC 854] http [RFC 2068] ftp [RFC 959] proprietary (e.g. RealNetworks) NFS proprietary

TCP=Transmission Control Protocol UDP=User Datagram Protocol

Implemented via network "sockets". Basic primitive that allows machines to send messages to each other

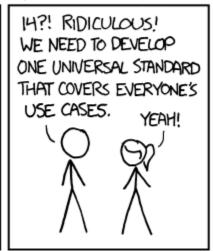

Distributed System Protocols!

Networking Protocols

The History of Internet Standards

HOW STANDARDS PROLIFERATE: (SEE: A/C CHARGERS, CHARACTER ENCODINGS, INSTANT MESSAGING, ETC.)

SITUATION: THERE ARE 14 COMPETING STANDARDS

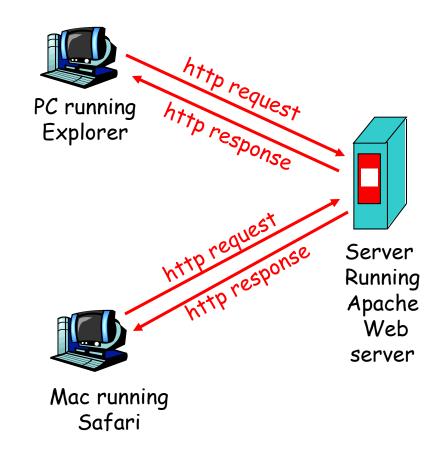

SOON: SITUATION: THERE ARE 15 COMPETING STANDARDS.

The Secret of the World Wide Web: the HTTP Standard

HTTP: hypertext transfer protocol

- WWW's application layer protocol
- client/server model
 - client: browser that requests, receives, and "displays" WWW objects
 - server: WWW server stores the website, and sends objects in response to requests
- http1.0: RFC 1945
- http1.1: RFC 2068
 - Leverages same connection to download images, scripts, etc.

The HTTP Protocol: More

http: TCP transport service:

- client initiates a TCP connection (creates socket) to server, port 80
- server accepts the TCP connection from client
- http messages (applicationlayer protocol messages) exchanged between browser (http client) and WWW server (http server)
- TCP connection closed

http is "stateless"

 server maintains no information about past client requests

Protocols that maintain session "state" are complex!

- past history (state) must be maintained and updated.
- if server/client crashes, their views of "state" may be inconsistent, and hence must be reconciled.
- RESTful protocols are stateless.

HTTP Example

Suppose user enters URL www.cs.uiuc.edu/

(contains text, references to 10 jpeg images)

- 1a. http client initiates a TCP connection to http server (process) at www.cs.uiuc.edu. Port 80 is default for http server.
- 2. http client sends a http request message (containing URL) into TCP connection socket

1b. http server at host www.cs.uiuc.edu waiting for a TCP connection at port 80. "accepts" connection, notifying client

3. http server receives request messages, forms a response message containing requested object (index.html), sends message into socket

HTTP Example (cont.)

- 4. http server closes the TCP connection (if necessary).
- 5. http client receives a response message containing html file, displays html, Parses html file, finds 10 referenced jpeg objects
- 6. Steps 1-5 are then repeated for each of 10 jpeg objects

time

For fetching referenced objects, have 2 options:

- non-persistent connection: only one object fetched per TCP connection
 - some browsers create multiple TCP connections simultaneously one per object
- persistent connection: multiple objects transferred within one TCP connection

A human as a browser (Client Side)

1. Telnet to your favorite WWW server:

telnet www.cnn.com 80

Opens TCP connection to port 80 (default http server port) at www.cnn.com
Anything typed in sent to port 80 at www.cnn.com

2. Type in a GET http request:

GET /index.html HTTP/1.0

By typing this in (hit carriage return twice), you send this minimal (but complete) GET request to http server

3. Look at response message sent by http server!

Does our Working Definition work for the http Web?

A distributed system is a collection of entities, each of which is autonomous, programmable, asynchronous and failure-prone, and that communicate through an unreliable communication medium.

- Entity=a process on a device (PC, PDA)
- Communication Medium=Wired or wireless network
- Our interest in distributed systems involves
 - design and implementation, maintenance, study, algorithmics

"Important" Distributed Systems Issues

- No global clock; no single global notion of the correct time (asynchrony)
- Unpredictable failures of components: lack of response may be due to either failure of a network component, network path being down, or a computer crash (failure-prone, unreliable)
- Highly variable bandwidth: from 16Kbps to Tbps
- Possibly large and variable latency: few ms to several seconds
- Large numbers of hosts: 2 to several million

There are a range of interesting problems for Distributed System designers

•

- Real distributed systems
 - Cloud Computing, Peer to peer systems, key-value stores/NoSQL, distributed file systems, sensor networks, measurements
- Classical Problems
 - Failure detection, Asynchrony, Snapshots, Multicast, Consensus, Mutual Exclusion, Election
- Concurrency
 - RPCs, Concurrency Control, Replication Control
- Security
 - Byzantine Faults
- Others...

•

Typical Distributed Systems Design Goals

Common Goals:

- Heterogeneity can the system handle a large variety of types of PCs and devices?
- Robustness is the system resilient to host crashes and failures, and to the network dropping messages?
- Availability are data, services always there for clients?
- Transparency can the system hide its internal workings from the users?
- Concurrency can the server handle multiple clients simultaneously?
- Efficiency is it fast enough?
- Scalability can it handle 100 million nodes? (nodes=clients and/or servers)
- Security can the system withstand hacker attacks?
- Openness is the system extensible?

"Important" Issues

- If you're already complaining that the list of topics we've discussed so far has been perplexing...
 - You're right!
 - It was meant to be (perplexing)
- The Goal for the Rest of the Course: see enough examples and learn enough concepts so these topics and issues will make sense
 - We will revisit many of these slides in the very last lecture of the course!

"Concepts"?

- Which of the following inventions do you think is the most important?
 - 1. Car
 - 2. Wheel
 - 3. Bicycle

"What lies beneath?" Concepts!

How will you Learn?

Take a look at handout "Course Information and Schedule"

- Text: Colouris, Dollimore, Kindberg and Blair (5th edition)
- Lectures
- Homeworks
 - Approx. one every two-three weeks
 - Solutions need to be typed, figures can be hand-drawn
- Programming assignments
 - Incremental, in 4 stages
 - We will build a real cloud computing system!
 - MP groups (== 2 students)
 - » Pair with someone taking course for same number of hours (3/4)
 - 4 credit students have to complete "Extra Credit" portion on each MP
- Exams/quizzes
 - Midterm + Final

On the Textbook

- Text: Colouris, Dollimore, Kindberg and Blair (5th edition).
- We will refer to section, chapter, and problem numbers only in the 5th edition.
 - Older editions may have a different numbering for some HW problems (that we give from the textbook). Make sure you solve the right problem; the responsibility is yours (no points for solving the wrong problem!)

What assistance is available to you?

Lectures

Source: http://dilbert.com

- lecture slides will be placed online at course website
 - » "Tentative" version before lecture
 - » "Final" version after lecture
- Homeworks office hours and discussion forum to help you (without giving you the solution).
- Programming Assignments (MPs) You can use any language, but we recommend C/C++ and Java ("best projects" code will be released in these) – office hours and discussion forum to help you (without giving you the solution).
- Course Prerequisite: CS 241 or ECE 391 or equivalent OS/networking course (latter need instructor permission)

You can meet us anytime

In person (Office Hours):

- Myself (Indy): 3112 Siebel Center
 - Every Tuesday and Thursday from 3.30 PM to 4.30 PM
- TA, Imranul Hoque:
 - Every Monday and Wednesday from 1 PM to 2.30 PM, in 0207 SC
- TA, Abhishek Verma: (out first week)
 - Every Wednesday 2.30 pm 4 pm and Friday 1 pm to 2.30 pm, in 0207 SC

(Check course website)

Virtually:

- Discussion Forum: Piazza (most preferable, monitored daily) –
 24 hour turnaround time for questions!
- Email (turnaround time may be longer than Piazza)

Readings

- For today's lecture: Relevant parts of Chapter 1
- Typically, before a lecture you will be expected to read the relevant chapter
- For next lecture
 - No readings! Topic: "Introduction to Cloud Computing"
 - Fill out and return Student InfoSheet
