

# CS/ECE 438: Communication Networks

Prof. Robin Kravets

# Course Information

## ■ Instructor

- Prof. Robin Kravets  
3114 SC  
217-244-6026  
rhk@illinois.edu

## ■ TAs

- Federico Cifuentes-Urtubey, Rohan Tabish,  
Chien-Ying Chen

## ■ Class Webpage

- <http://courses.engr.illinois.edu/cs438/>

# [ Course Information

- Use Piazza for all class related communication
  - Announcements and discussions
    - <http://www.piazza.com/illinois/cs438>
      - All class questions
      - This is your one-stop help-line!
      - Will get answer < 24 hours
    - For personal communications, do not send email
      - Use the private message function on Piazza

# [ Course Information ]

- Text book
  - Computer Networks: A Systems Approach, by Peterson and Davie, 5th Ed. (minor differences from 4th edition)
- Supplemental Text books
  - UNIX Network Programming, by Stevens

# [Prerequisites]

- Operating Systems Concepts
  - CS 241 or ECE 391 or equivalent
    - Threads, memory management, sockets
- C or C++ Programming
  - Preferably Unix
- Probability and Statistics

# [ Grading Policy ]

- Homework 14%
  - 7 homework assignments
- Programming Projects 46%
  - MP0 3%, MP1 11%, MP2 16%, MP3 16%
- Midterm Exam 15%
  - March 4, 7 - 9PM
- Final Exam 25%
  - TBA

# [ Homework and Projects ]

## ■ Homework

- 7 homeworks each worth 2%
- Due Wednesdays at start of class.
- General extension to Fridays start of class (hard deadline).
  - Solutions handed out on Fridays
- No questions to Professor, TAs or on Piazza after class on Wednesday.

## ■ Projects

- Late policy for projects - 2% off per hour late
- MP0 and MP1 are solo
- MP2 and MP3 are 2 person teams

# [Regrades]

- Within one week of posting of grades for a homework, MP or exam
- Regrades must be submitted in writing on a separate piece of paper
  - Please do not write on your homework, MP or Exam

# [ Academic Honesty ]

- Your work in this class **must** be your own.
- If students are found to have cheated (e.g., by copying or sharing answers during an examination or sharing code for a project), **all** involved will at a minimum receive grades of 0 for the first infraction.
  - We will run a similarity-checking system on code and binaries
- Further infractions will result in failure in the course and/or recommendation for dismissal from the university.
- Department honor code:  
[\*\*https://cs.illinois.edu/academics/honor-code\*\*](https://cs.illinois.edu/academics/honor-code)

# [What is cheating in a programming class?

- At a minimum
  - Copying code
  - Copying pseudo-code
  - Copying flow charts
- Consider
  - Did some one else tell you how to do it?
- Does this mean I can't help my friend?
  - No, but don't solve their problems for them

# [ Graduate Students ]

- Graduate students MAY take an extra one hour project in conjunction with this class
  - Graduate students
    - Write a survey paper in a networking research area of your choice
    - Project proposal with list of 10+ academic references (no URL's) due February 20<sup>th</sup>
    - Paper due last day of class
  - Undergraduates may not take this project course
    - However, if you are interested in networking research, please contact me

# Goal: foundational view of computer networks

- Fundamental challenges of computer networking
- Design principles of computer networks
- From principles to practical protocols
- Build real network applications

# [ Course Contents ]

- Introduction to UNIX Network Programming
- Direct Link Networks
- Packet Switched Networks
- Routing
- Internetworking
- End-to-End Protocols
- Congestion Control
- Mobile Networks
- Network Security
- ... more if there is time

# [ Complete Schedule ]

- See class webpage
- <http://www.cs.illinois.edu/class/cs438>
  - Schedule is dynamic
  - Check regularly for updates
- Content
  - Slides will be posted by the night before class
    - Some class material may not be in slides
      - Examples may be worked out in class

# What do these two things have in common?

■ First printing press

■ The Internet

Both lowered the cost of distributing information  
and changed human society

# A Brief History of the Internet

# [Visionaries]

- Vannevar Bush, “As we may think” (1945):
  - memex - an adjustable microfilm viewer
- J. C. R. Licklider (1962): “Galactic Network”
  - Concept of a global network of computers connecting people with data and programs
  - First head of DARPA computer research, October 1962
  - Funded Arpanet

Bush

Licklider

# [ Circuit switching

1920s

1967

# [ 1961-64: Packet switching ]

- Leonard Kleinrock
  - Queueing-theoretic analysis of packet switching in MIT Ph.D. thesis (1961-63) demonstrated value of statistical multiplexing
- Paul Baran (RAND), Donald Davies
  - Concurrent work from (National Physical Laboratories, UK)

Circuit switching

Packet switching

Kleinrock

Baran

# [ 1961-64: Packet switching ]

Circuit Switching	Datagram packet switching

# [ 1961-64: Packet switching ]

Circuit Switching	Datagram packet switching
Physical channel carrying stream of data from source to destination	
Three phase: setup, data transfer, tear-down	
Data transfer involves no routing	

# [ 1961-64: Packet switching ]

Circuit Switching	Datagram packet switching
Physical channel carrying stream of data from source to destination	Message broken into short packets, each handled separately
Three phase: setup, data transfer, tear-down	One operation: send packet
Data transfer involves no routing	Packets <b>stored</b> (queued) in each router, <b>forwarded</b> to appropriate neighbor

# [ 1965: First computer network ]

- Lawrence Roberts and Thomas Merrill connect a TX-2 at MIT to a Q-32 in Santa Monica, CA
- ARPA-funded project
- Connected with telephone line – it works, but it's inefficient and expensive – confirming motivation for packet switching

Roberts

# [ The ARPANET begins ]

- Roberts joins DARPA (1966), publishes plan for the ARPANET computer network (1967)
- December 1968: Bolt, Beranek, and Newman (BBN) wins bid to build packet switch, the Interface Message Processor (IMP)
- September 1969: BBN delivers first IMP to Kleinrock's lab at UCLA

An older Kleinrock  
with the first IMP

# [ ARPANET comes alive ]

Stanford Research Institute  
(SRI)

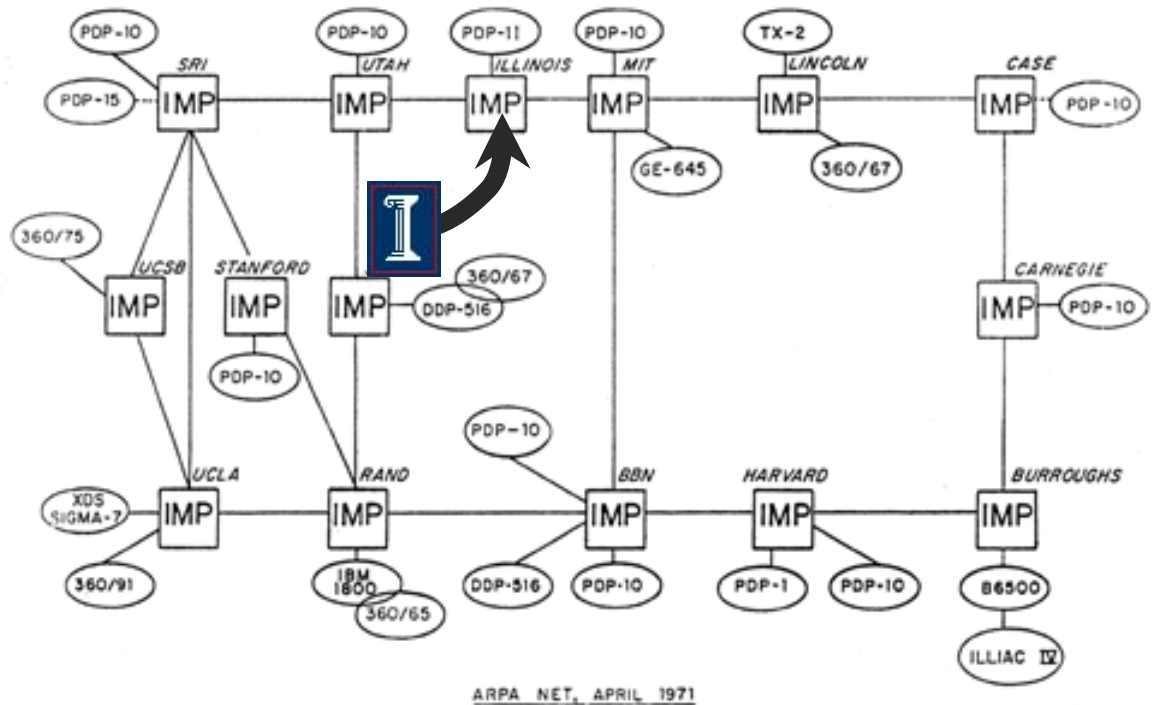

UCLA

“LO”  
Oct 29, 1969

# [ ARPANET grows ]

- Dec 1970:  
ARPANET  
Network Control  
Protocol (NCP)
- 1971:  
Telnet, FTP
- 1972:  
Email (Ray  
Tomlinson, BBN)
- 1979:  
USENET

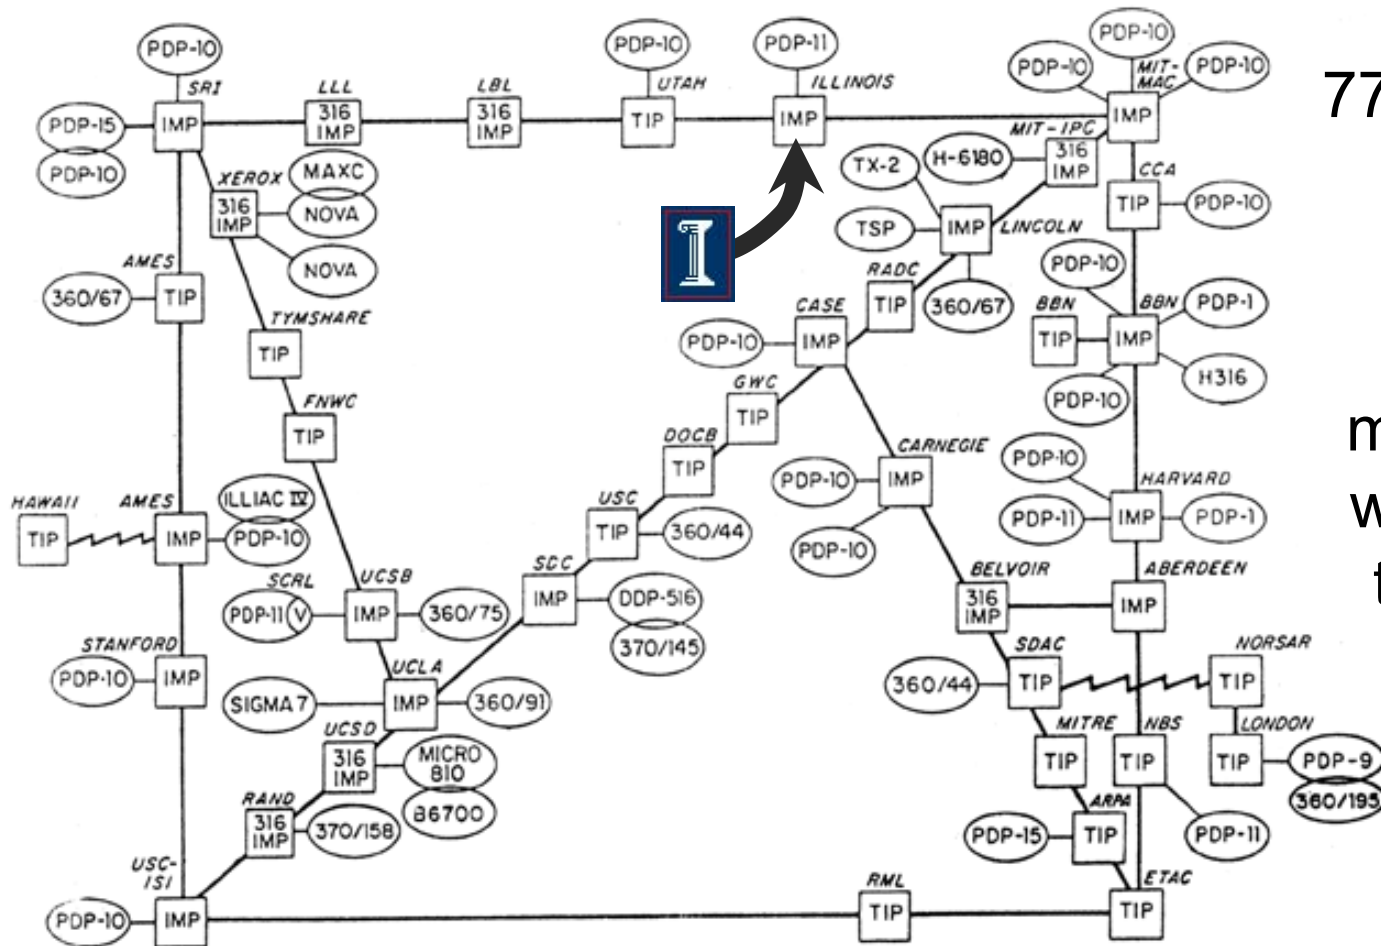

ARPANET, April 1971

# [ And grows ... ]

ARPA NETWORK, LOGICAL MAP, SEPTEMBER 1973

77 nodes

How  
many do  
we have  
today?

# [ARPANET to Internet]

- Meanwhile, other networks such as PRnet, SATNET developed
- May 1973: Vinton G. Cerf and Robert E. Kahn present first paper on interconnecting networks
- Concept of connecting diverse networks, unreliable datagrams, global addressing, ...
- Became TCP/IP

2004 Turing Award!

Kahn

Cerf

# [ TCP/IP deployment ]

OSI Reference  
Model's layers

- TCP/IP implemented on mainframes by groups at Stanford, BBN, UCL
- David Clark implements it on Xerox Alto and IBM PC
- 1982: International Organization for Standards (ISO) releases Open Systems Interconnection (OSI) reference model
  - Design by committee didn't win out
- January 1, 1983: "Flag Day" NCP to TCP/IP transition on ARPANET

# [ OSI Protocol Stack ]

- Application: Application specific protocols
- Presentation: Format of exchanged data
- Session: Name space for connection mgmt
- Transport: Process-to-process channel
- Network: Host-to-host packet delivery
- Data Link: Framing of data bits
- Physical: Transmission of raw bits

# [Growth from Ethernet

- Ethernet
  - R. Metcalfe and D. Boggs, July 1976
- Spanning Tree protocol
  - Radia Perlman, 1985
- Made local area networking easy

Metcalfe

Perlman

# Growth spurs organic change

- Early 1980s
  - Many new networks: CSNET, BITNET, MFENet, SPAN (NASA), ...
- Nov 1983
  - DNS developed by Jon Postel, Paul Mockapetris (USC/ISI), Craig Partridge (BBN)
- 1984
  - Hierarchical routing: EGP and IGP (later to become eBGP and iBGP)

Postel

Partridge

Mockapetris

# [ NSFNET ]

- 1984: NSFNET for US higher education
  - Serve many users, not just one field
  - Encourage development of private infrastructure (e.g., initially, backbone required to be used for Research and Education)
  - Stimulated investment in commercial long-haul networks
- 1990: ARPANET ends
- 1995: NSFNET decommissioned

NSFNET backbone, 1992

# [ Explosive growth! ]

# [ Why is Networking Challenging ]

That's it! ...right?

# Fundamental Challenge: Speed of Light

- How long does it take light to travel from UIUC to Mountain View, CA (Google Headquarters)?
- Answer:
  - Distance UIUC → Mountain View is 2,935 km
  - Traveling 300,000 km/s: 9.78ms
- Note: Dependent on transmission medium
  - $3.0 \times 10^8$  meters/second in a vacuum
  - $2.3 \times 10^8$  meters/second in a cable
  - $2.0 \times 10^8$  meters/second in a fiber

# Fundamental Challenge: Speed of Light

- How long does it take an Internet “packet” to travel from UIUC to Mountain View?
- Answer:
  - For sure  $\geq 9.78\text{ms}$
  - But also depends on:
    - The route the packet takes (could be circuitous!)
    - The propagation speed of the links the packet traverses
      - e.g. in optical fiber light propagates only at  $2/3 C$
    - The transmission rate (bandwidth) of the links (bits/sec)
      - And also the size of the packet
    - Number of hops traversed (“store and forward” delay)
    - The “competition” for bandwidth the packet encounters (congestion). It may have to wait in router queues.
  - In practice this boils down to  $\geq 40\text{ms}$  (and likely more)
    - With variance (can be hard to predict!)

# [Performance]

## ■ Bandwidth/throughput

- Data transmitted per unit time
- Example: 10 Mbps
- Link bandwidth vs. end-to-end bandwidth

- Notation

- $\text{KB} = 2^{10} \text{ bytes}$
- $\text{Mbps} = 10^6 \text{ bits per second}$

## ■ Latency/delay

- Time from A to B
- Example: 30 msec
- Many applications depend on round-trip time (RTT)

Why?

You will mess this up at least once on a HW or exam!

# [ Delay x Bandwidth Product

- Amount of data in “pipe”
  - channel = pipe
  - delay = length
  - bandwidth = area of a cross section
  - bandwidth x delay product = volume

# [ Delay x Bandwidth Product

- Bandwidth x delay product
  - How many bits the sender must transmit before the first bit arrives at the receiver if the sender keeps the pipe full
  - Takes another one-way latency to receive a response from the receiver

# [ Delay x Bandwidth Product

- Bandwidth x delay product
  - How many bits the sender must transmit before the first bit arrives at the receiver if the sender keeps the pipe full
  - Takes another one-way latency to receive a response from the receiver

# [ Delay x Bandwidth Product ]

- Bandwidth x delay product
  - How many bits the sender must transmit before the first bit arrives at the receiver if the sender keeps the pipe full
  - Takes another one-way latency to receive a response from the receiver

# [ Delay x Bandwidth Product ]

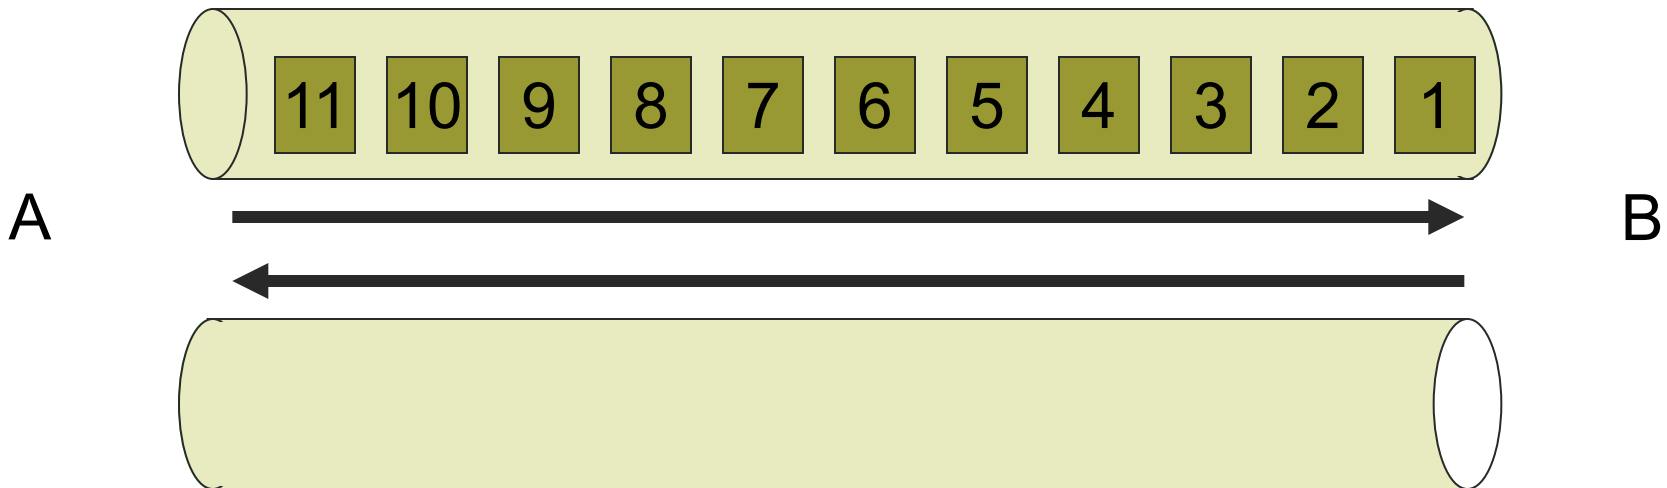

- Bandwidth x delay product
  - How many bits the sender must transmit before the first bit arrives at the receiver if the sender keeps the pipe full
  - Takes another one-way latency to receive a response from the receiver

# [ Delay x Bandwidth Product ]

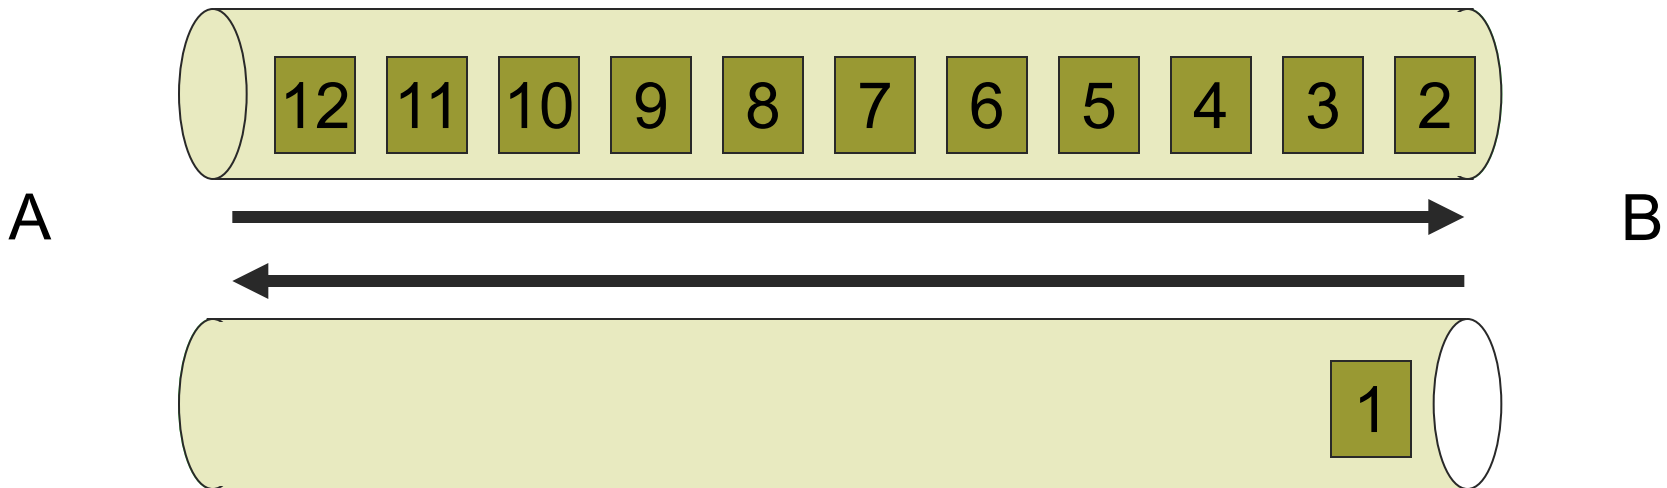

- Bandwidth x delay product
  - How many bits the sender must transmit before the first bit arrives at the receiver if the sender keeps the pipe full
  - Takes another one-way latency to receive a response from the receiver

# [ Delay x Bandwidth Product

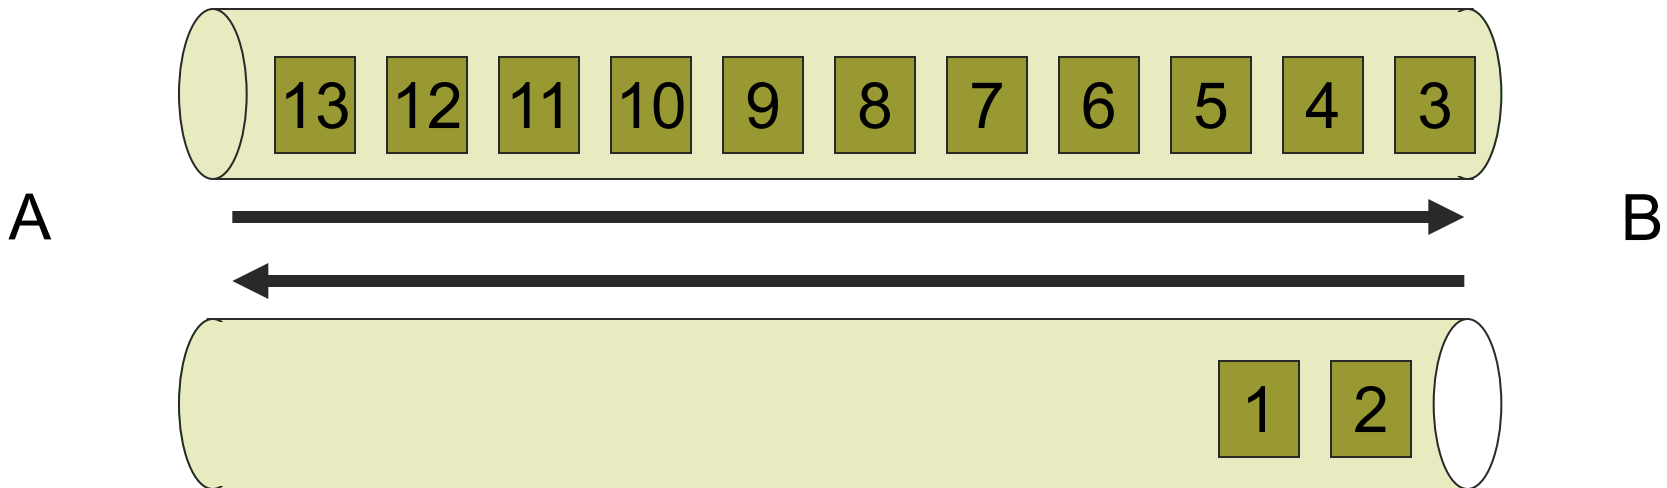

- Bandwidth x delay product
  - How many bits the sender must transmit before the first bit arrives at the receiver if the sender keeps the pipe full
  - Takes another one-way latency to receive a response from the receiver

# [ Delay x Bandwidth Product ]

- Bandwidth x delay product
  - How many bits the sender must transmit before the first bit arrives at the receiver if the sender keeps the pipe full
  - Takes another one-way latency to receive a response from the receiver

# [ Delay x Bandwidth Product ]

- Bandwidth x delay product
  - How many bits the sender must transmit before the first bit arrives at the receiver if the sender keeps the pipe full
  - Takes another one-way latency to receive a response from the receiver (round trip BxD)

# [ Delay x Bandwidth Product ]

## ■ Example: Transcontinental Channel

- BW = 45 Mbps

- delay = 50ms

- bandwidth x delay product

$$= (50 \times 10^{-3} \text{ sec}) \times (45 \times 10^6 \text{ bits/sec})$$

$$= 2.25 \times 10^6 \text{ bits}$$

ms

Mbps

# Bandwidth vs. Latency

## ■ Relative importance

- 1-byte: Latency bound
  - 1ms vs 100ms latency dominates 1Mbps vs 100Mbps BW
- 25MB: Bandwidth bound
  - 1Mbps vs 100Mbps BW dominates 1ms vs 100ms latency

# [ Bandwidth vs. Latency ]

- Infinite bandwidth
  - RTT dominates
    - $\text{Throughput} = \text{TransferSize} / \text{TransferTime}$
    - $\text{TransferTime} = \text{RTT} + 1/\text{Bandwidth} \times \text{TransferSize}$
- Its all relative
  - 1-MB file on a 1-Gbps link looks like a 1-KB packet on a 1-Mbps link

# Fundamental Challenge: Speed of Light

- How many **cycles** does your PC execute before it can possibly get a reply to a message it sent to a Mountain View web server?
- Answer
  - **Round trip** takes  $\geq 80\text{ms}$
  - PC runs at (say) 3 GHz
  - $3,000,000,000 \text{ cycles/sec} * 0.08 \text{ sec} = 240,000,000 \text{ cycles}$
- Thus
  - Communication feedback is always dated
  - Communication fundamentally asynchronous

# Fundamental Challenge: Speed of Light

- What about machines directly connected (via a local area network or LAN)?
- Answer:

```
% ping www.cs.uiuc.edu
PING dcs-www.cs.uiuc.edu (128.174.252.83) 56(84) bytes of data.
64 bytes from 128.174.252.83: icmp_seq=1 ttl=63 time=0.263 ms
64 bytes from 128.174.252.83: icmp_seq=2 ttl=63 time=0.595 ms
64 bytes from 128.174.252.83: icmp_seq=3 ttl=63 time=0.588 ms
64 bytes from 128.174.252.83: icmp_seq=4 ttl=63 time=0.554 ms
...
```

- $500\mu\text{s} = 1,500,000$  cycles
  - Still a loooooong time...

# Fundamental Challenge: Shared infrastructure

- Different parties must work together
  - Multiple parties with different agendas must agree how to divide the task between them
- Working together requires
  - Protocols (defining who does what)
    - These generally need to be standardized
  - Agreements regarding how different types of activity are treated (policy)
- Different parties very well might try to “game” the network’s mechanisms to their advantage

# Fundamental Challenge: Shared infrastructure

- Physical links and switches must be shared among many users

- Common multiplexing strategies
  - (Synchronous) time-division multiplexing (TDM)
  - Frequency-division multiplexing (FDM)

# Fundamental Challenge: Shared infrastructure

- Statistical Multiplexing (SM)
  - On-demand time-division multiplexing
  - Scheduled on a per-packet basis
  - Packets from different sources are interleaved
  - Uses upper bounds to limit transmission
    - Queue size determines capacity per source

# Fundamental Challenge: Shared infrastructure

- Packets buffered in switch until forwarded
- Selection of next packet depends on policy
  - How do we make these decisions in a fair manner?  
Round Robin? FIFO?
  - How should the switch handle congestion?

# Fundamental Challenge: Things break

- Communication involves a chain of interfaces, links, routers, and switches...

...stitched together with many layers of software...

...all of which must function correctly!

# Fundamental Challenge: Things break

- Suppose a communication involves 50 components that work correctly (independently) 99% of the time.
- What's the likelihood the communication **fails** at a given point in time?
  - Answer: success requires that they all function, so failure probability =  $1 - 0.99^{50} = 39.5\%$
- So we have a lot of components, which tend to fail...
  - ... and we may not find out for a loooong time

# Fundamental Challenge: Enormous dynamic range

- Challenge: enormous dynamic range
  - Round trip times (**latency**) 10 us's to sec's ( $10^5$ )
  - Data rates (**bandwidth**) kbps to 10 Gbps ( $10^7$ )
  - **Queuing** delays in the network 0 to sec's
  - **Packet loss** 0 to 90+%
  - End system (**host**) capabilities cell phones to clusters
  - Application needs: size of transfers, bidirectionality, reliability, tolerance of **jitter**

# Fundamental Challenge: Enormous dynamic range

- Challenge: enormous dynamic range
- Related challenge: very often, there is no such thing as “typical”
  - Beware of your “mental models”!
  - Must think in terms of design ranges, not points
  - Mechanisms need to be adaptive

# Fundamental Challenge: Security

- Challenge: there are Bad Guys out there!
- Early days
  - Vandals
  - Hackers
  - Crazies
  - Researchers
- As network population grows, it becomes more and more attractive to crooks
- As size of and dependence on the network grows, becomes more attractive to spies, governments, and militaries

# Fundamental Challenge: Security

- Attackers seek ways to misuse the network towards their gain
  - Carefully crafted “bogus” traffic to manipulate the network’s operation
  - Torrents of traffic to overwhelm a service (**denial-of-service**) for purposes of extortion/competition
  - Passively recording network traffic in transit (**sniffing**)
  - Exploit flaws in clients and servers using the network to trick into executing the attacker’s code (**compromise**)
- They all do this energetically because there is significant **\$\$\$** to be made

# [The Ultimate Challenge]

- Cannot reboot the Internet
  - Everyone depends on the Internet
    - Businesses
    - Hospitals
    - Education institutions
    - Financial sector
    - ...
- Fixing the Internet akin to changing the engine while you are flying the plane!

# Why Networking is Challenging

- Tubes: not entirely wrong, but simplistic
- How do we build a communication infrastructure for all of humanity?
- Must design for extreme heterogeneity across technology, applications, users

# [What's next]

- MP 0
  - Available Friday
  - Sockets refresher
- HW 1
  - Available Friday
- Next topic
  - UNIX network programming
- Next week
  - Technical overview of Internet architecture
  - Data link technologies
