#### CS 439: Wireless Networking

MAC Layer – Bluetooth

© CS 439 Staff, University of Illinois Fall 2022

## Bluetooth

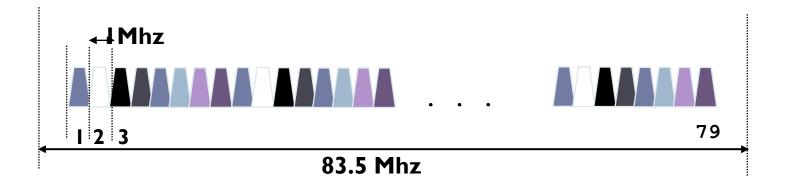

- Harald Blaatand
   "Bluetooth" II
  - King of Denmark 940-981 AC
- Runic stones in his capital city of Jelling
  - The stone's inscription ("runes") says:
    - Harald Christianized the Danes
    - Harald controlled the Danes
    - Harald believes that devices shall seamlessly communicate [wirelessly]

## Classic Bluetooth

- Cable replacement
  - > 2.4 GHz
  - FHSS over 79 channels (of IMHz each), I600hops/s
  - IMbps
    - Upgraded to 1 or 2 Mbps in 5.0
  - Coexistence of multiple piconets
  - I0 meters (extendible to 100 meters)
    - Max Tx Power 10dB (extendible to 20dB in 5.0)

## Bluetooth Radio

- MA scheme: Frequency hopping spread spectrum.
  - > 2.402 GHz + k MHz, k=0, ..., 78
  - I,600 hops per second.
  - I Mbps data rate.
  - Upgraded to 2 Mbps in BT 5.0

# Bluetooth Network Topology

# Radio designation

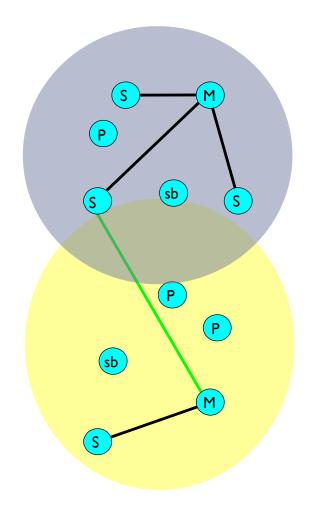

- Connected radios can be master or slave
- Radios are symmetric (same radio can be master or slave)

## Piconet

- Master can connect to 7 simultaneous or 200+ inactive (parked) slaves per piconet
- Each piconet has maximum capacity (I Mbps)
- Unique hopping pattern/ID

#### Scatternet

- High capacity system
- Minimal impact with up to 10 piconets within range
- Radios can share piconets!

# Bluetooth – Contention-free MAC

#### Master performs medium access control

Schedules traffic through polling.

# Time slots alternate between master and slave transmission

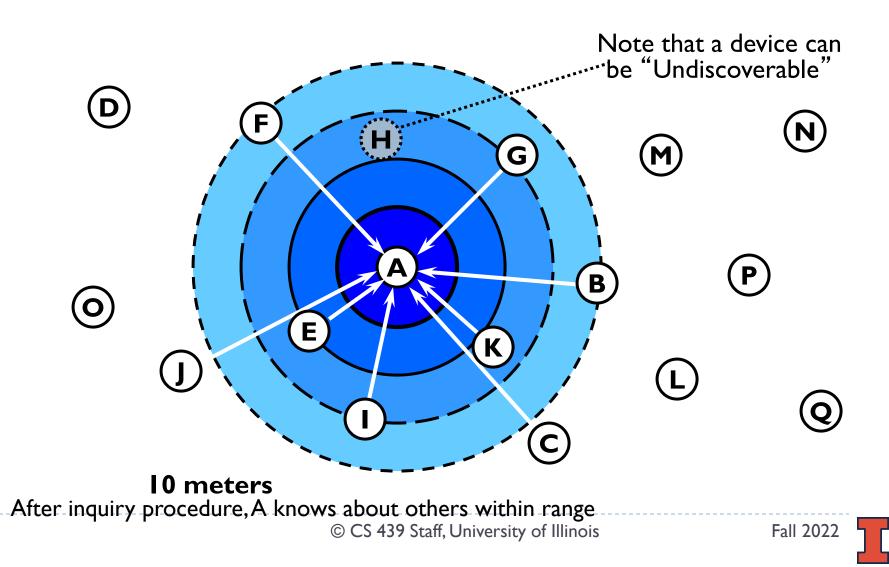

- Master-slave
  - Master includes slave address.
- Slave-master
  - Only slave chosen by master in previous master-slave slot allowed to transmit.
- If master has data to send to a slave, slave polled implicitly; otherwise, explicit poll.

# Bluetooth Device Discovery - Inquiry

## Device discovery

- Sends out an inquire, which is a request for nearby devices (within 10 meters)
- Devices that allow themselves to be discoverable issue an inquiry response
- Listeners respond with their address
- Can take up to 10.24 seconds, after which the inquiring device should know everyone within 10 meters of itself

#### Bluetooth Device Discovery - Inquiry

# Bluetooth Inquiry

### Sender

- Inquiry sent on 16 different frequencies
- I6 channel train
  - about 1.28 seconds per channel
  - One full 16 channel train takes 10ms

#### Receiver (device in standby mode)

- Scans long enough for an inquiring device to send the inquiry on 16 frequencies
- Scan must be frequent enough to guaranteed wake up during a 16 channel train
  - Enters inquiry scan state at least once every 1.28 seconds, and stays in that state for 10ms

# Bluetooth Inquiry - Reliability

#### Challenge

- Noisy channels
- Lost packets
  - Train scan is repeated up to 4 times for each train (10.24 seconds)
  - Designed to successfully communicate at least once with all devices within range

# BLE Highlights

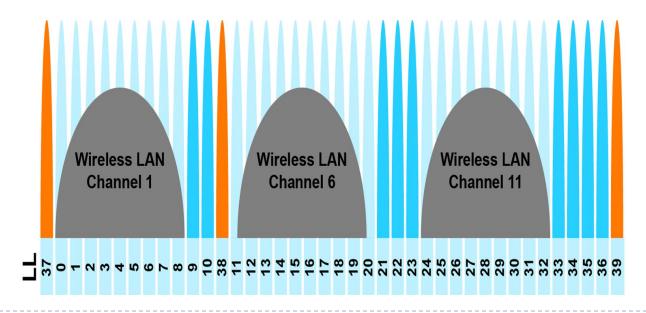

- Shared wireless channel
  - BLE operates in the 2.4 GHz ISM band with Wi-Fi and other technologies (phones, microwave ovens ...)
- BLE = Bluetooth Low Energy
  - Improved discovery
  - Key component: Beacons
    - Tags send out advertising beacons (typ. dist 30ft)
      - Phones scan for beaco--

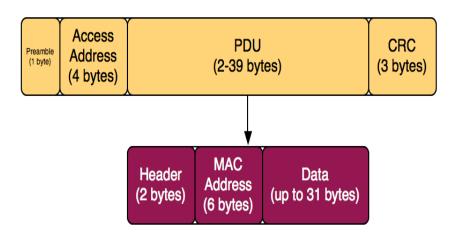

#### BLE Highlights: Channel Use and Coexistence with Wi-Fi

- Separate advertising and connected channels
  - Key: Three disjoint advertising channels (37, 38, 39)
  - Positioned between Wi-Fi channels (1, 6, 11)

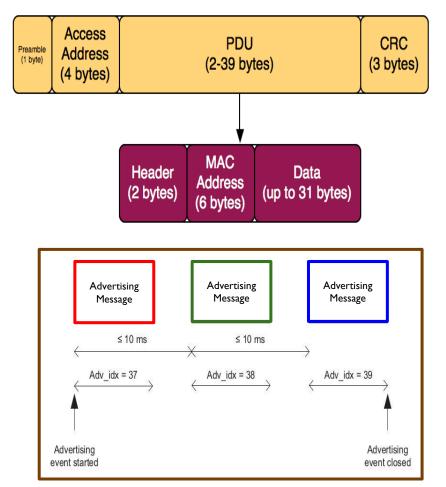

# BLE Highlights: Advertising

- Advertising Tags
- Advertising Messages
  - Header + MAC Address
    - + up to 31 Bytes of data
    - ~200 400 usec per packet
  - Two types: Nonscannable, Scannable

# BLE Highlights: Advertising

- Advertising Tags
- Advertising Messages
  - Header + MAC Address + up to 31 Bytes of data
    - ~200 400 usec per packet
  - Two types: Non-scannable, Scannable
- Advertising Event
  - One advertising message sent out on each advertising channel (37, 38, 39)

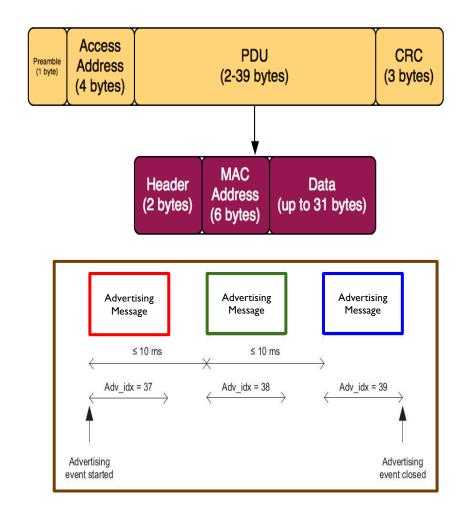

# BLE Highlights: Advertising

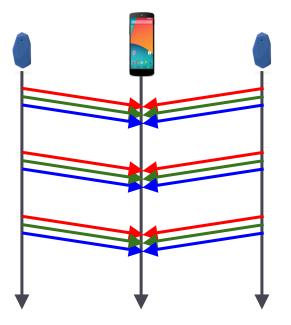

- Advertising Tags
- Advertising Messages
  - Header + MAC Address + up to 31 Bytes of data
    - ~200 400 usec per packet
  - Two types: Non-scannable, Scannable

#### Advertising Event

- One advertising message sent out on each advertising channel (37, 38, 39)
- Advertising Interval
  - One advertising event per advertising interval
  - e.g., every I sec or 100 msec

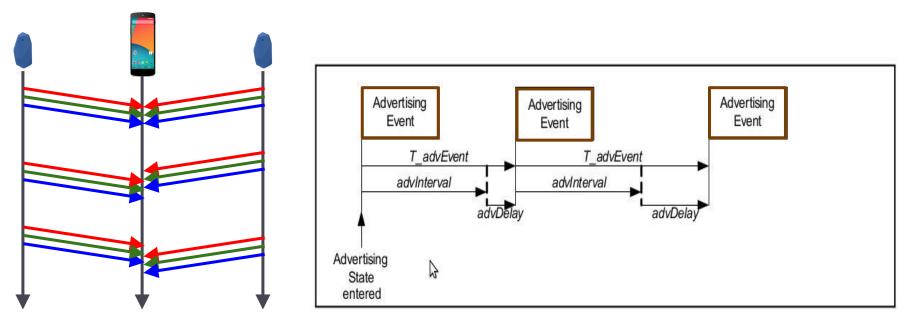

BLE Highlights: Advertising and Collisions

 If tags get synchronized, all advertising messages will collide

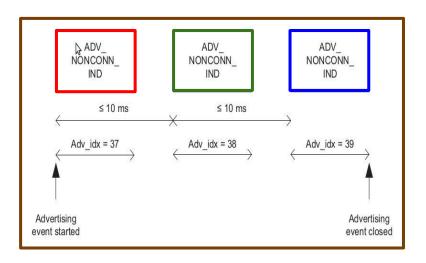

### BLE Highlights: Advertising and Collisions

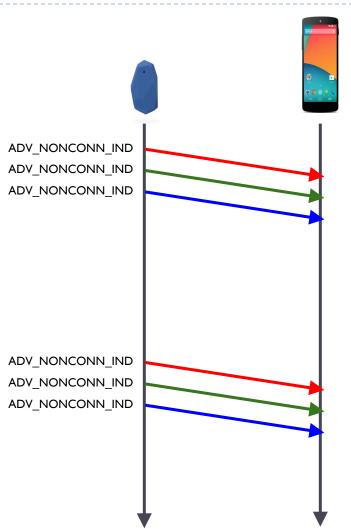

- Collision avoidance
  - Jitter advertising times
  - advDelay is added on to the end of each advertising event
  - advDelay = rand [0,10ms]

#### BLE Highlights: Tags Types - Non-Scannable

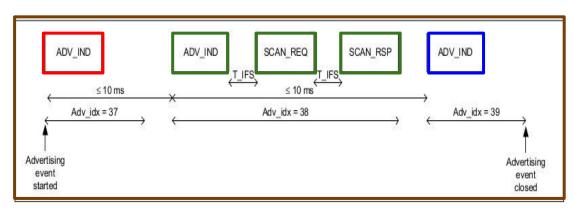

- Non-Scannable Tags
- Ex. gBeacon v3, iBeacon (?)
- Tags send ADV\_NONCONN\_IND messages
- Typically sent back-to-back
- Scanners listen, but do not respond

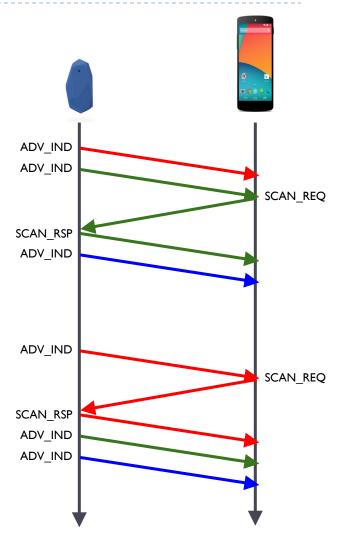

# BLE Highlights: Tags Types - Scannable

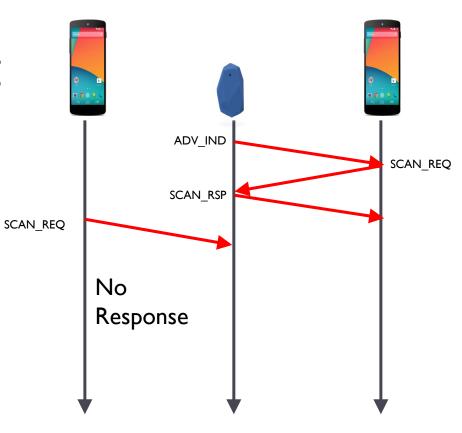

- Scannable Tags
- Ex. gBeacon VI, Estimote
- Tags send ADV\_IND messages
- Scanners respond with SCAN\_REQ message
- Tags respond with SCAN\_RSP message
  Up to 31 Bytes of extra data
- Tags wait ~150 usec for a request after beacon

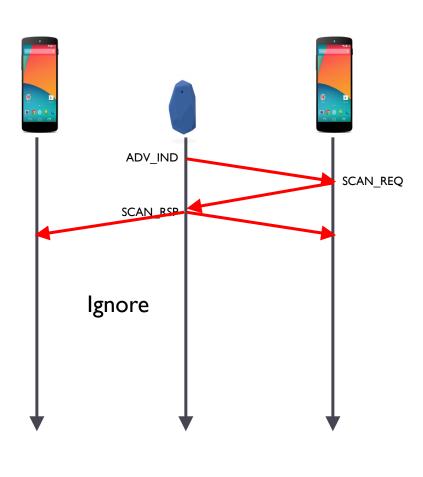

## Scannable Tags

## One SCAN\_RSP per channel per advertising event

# Scannable Tags

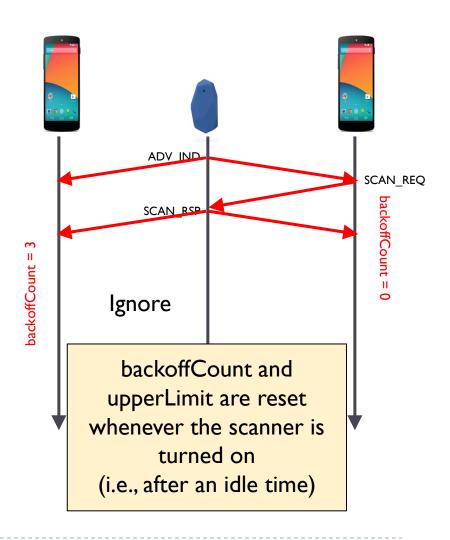

- ONLY accept SCAN\_RSP if SCAN\_REQ was sent to that tag on that channel during that advertising event
- Some collision tolerance
  - Any requesting scanner can receive a SCAN\_RSP as long as one SCAN\_REQ is received and the tag responds
  - BUT, No SCAN\_RSP if all SCAN\_REQs collide

# SCAN\_REQ Collision Avoidance

#### Scanner backoff procedure

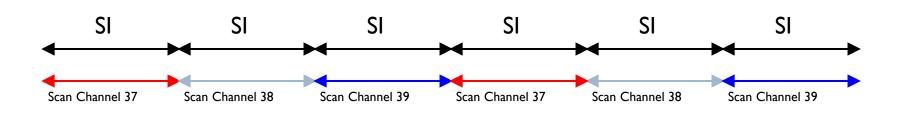

- Two parameters
  - backoffCount, upperLimit
- On starting scan
  - upperLimit = I, backoffCount = I
- Decrement backoffCount on receipt of ADV message
  - Only send SCAN\_REQ if backoffCount == 0
- Adapt upperLimit based on success or failure of receipt of SCAN\_RSP
  - Reset backoffCount
  - backoffCount = rand (I, upperLimit)

# BLE Highlights: Low-level Scanning

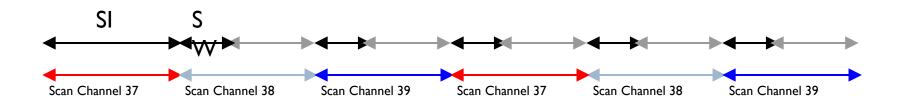

## Scanners

- Scan for tags on sequential channels (37, 38, 39)
- Scan Interval (SI)
  - Time spent on a channel

# BLE Highlights: Low-level Scanning

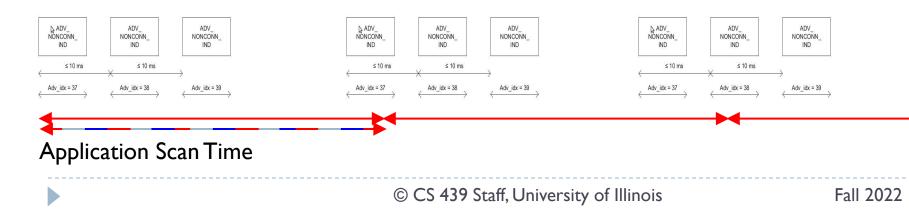

- Scan Time
  - Scan Int == Scan Window
     ⇒ Always on
- Scanners
- Scan for tags on sequential channels (37, 38, 39)
- Scan Interval (SI)
  - Time spent on a channel
- Scan Window (SW)
  - Time spent scanning at beginning of Scan Interval

#### BLE Highlights: Application-level Scanning

## Scanners

- Application Scan Time
  - > Tag Advertising Interval

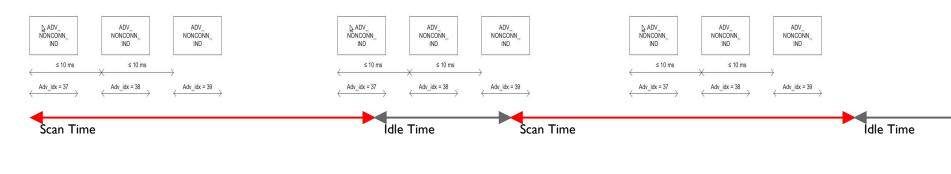

## BLE Highlights: Application-level Scanning

Scan Time

- I 00% on Idle Time = 0
- (Continuous scanning)
  - I 0% on Idle Time = I 0 \* Scan Time

- Scanners
- Application Scan
   Time
  - > Tag Advertising Interval
- Application Idle Time

Fall 2022

# BLE Highlights: MAC Behavior

#### No Carrier Sense

• Tag does not listen for a clear channel before sending any message

#### Minimal Contention Avoidance

- Jitter length of advertising interval + rand [0, 10 ms]
- Backoff for sending SCAN\_REQ

#### Other parameters

- Inter-frame spacing
- Channel switching delay
- Scan Interval
- Scan Window scanning)

150us (from spec)274us (from Nordic)11.25ms (from spec/Nexus 5)11.25ms (continuous

## BLE in the Real World

BLE beacons (or tags)
Location-specific information
Deployed in public places
Stores, airports, museums
Accessed via phones with BLE

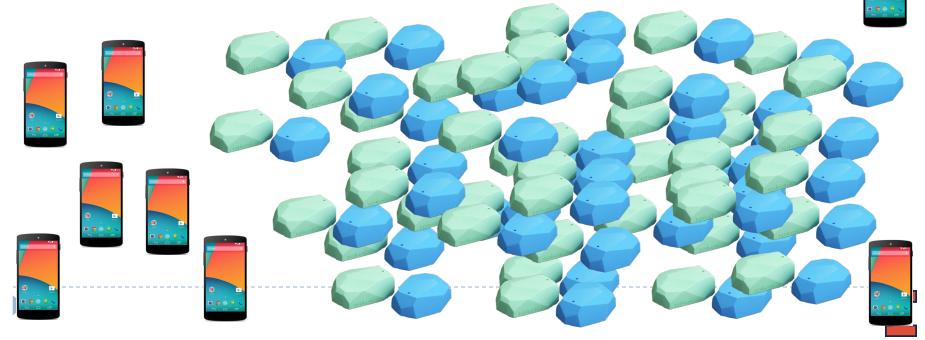

- Performance questions
  - How long does it take to detect a nearby tag?
  - Can we detect a tag within 5
    - sec with 95% success?

## BLE in the Real World - Density

- As deployments increase, how will the tags behave?
  - What is the effect of high density tags and phones on tag discovery?

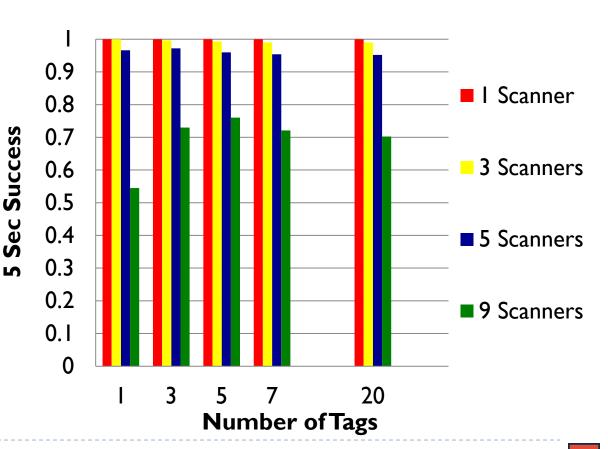

## **Evaluating Tag Behavior**

- Environmental Impact
  - At what density of tags or phones does the system break down?
- Metric
  - 5 Sec Success
    - Could the tag be found in 5 sec?
    - Checked every I sec over the whole run

## Evaluation: BLE Scan/Response

#### 5 second success

- Multiple chances to find the tag
- Success decreases significantly as more phones are added
   Number of phones is more
  - phones is more important than number of tags

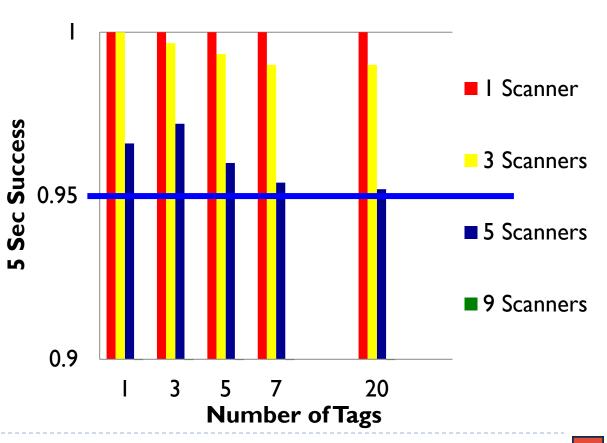

## Evaluation: BLE Scan/Response

5 second

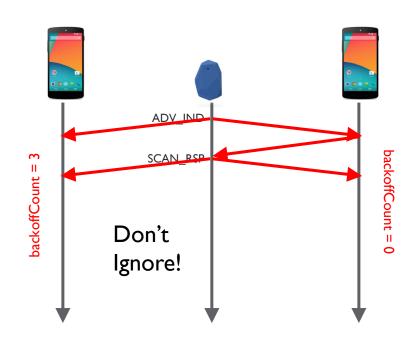

success

Below target
 threshold for
 more than 5
 phones

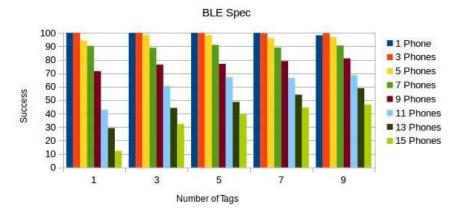

# SCAN\_REQ: Opportunistic Listening

- Accept a SCAN\_RSP on a channel if a SCAN\_REQ would have been sent, but the backoff procedure indicated not to send it
  - Any requesting or backing off scanner can receive a SCAN\_RSP as long as one SCAN\_REQ is received and the tag responds
  - Still, No SCAN\_RSP if all SCAN\_REQs collide

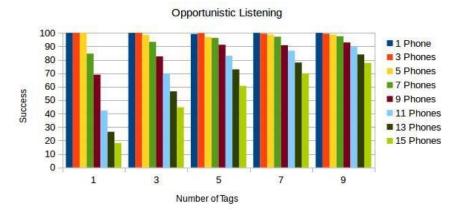

#### Opportunistic Listening: Simulation Comparison

- Significant increase in success rate as number of phones increases
- Cannot prevent SCAN\_REQ collisions

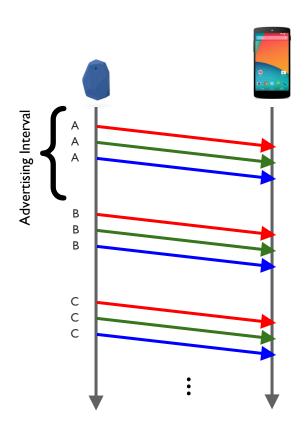

5 Sec Success

5 Sec Success

#### **Beacon Trains**

- Approach
  - Advertising data is broken in n beacons
    - For n = 5:A,B,C,D,E
    - Max 31 bytes
  - Alternate sending data in nonscannable beacons
    - Send A in 1st advertising interval, Send B in 2nd advertising interval, etc
    - Must receive all n to get complete advertising data

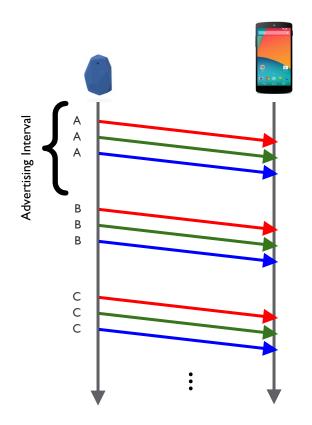

#### Beacon Trains

# Approach

Pro

- Advertising data = n \* 31
- Con
  - Delay to receive all n packets in a train

## Evaluation

## Goal

 Evaluate effect of higher tag density on tag discovery for beacon trains

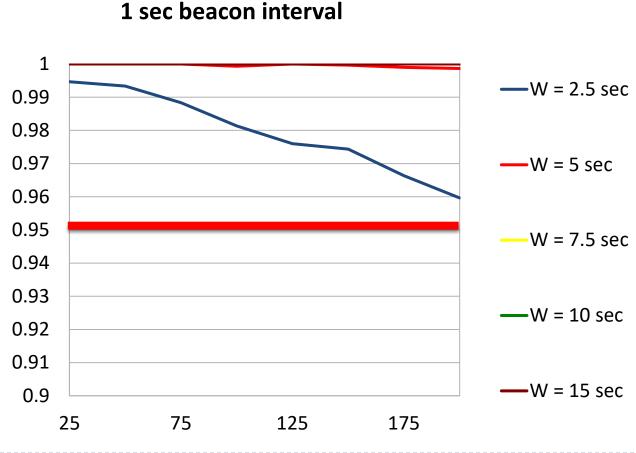

## Parameters

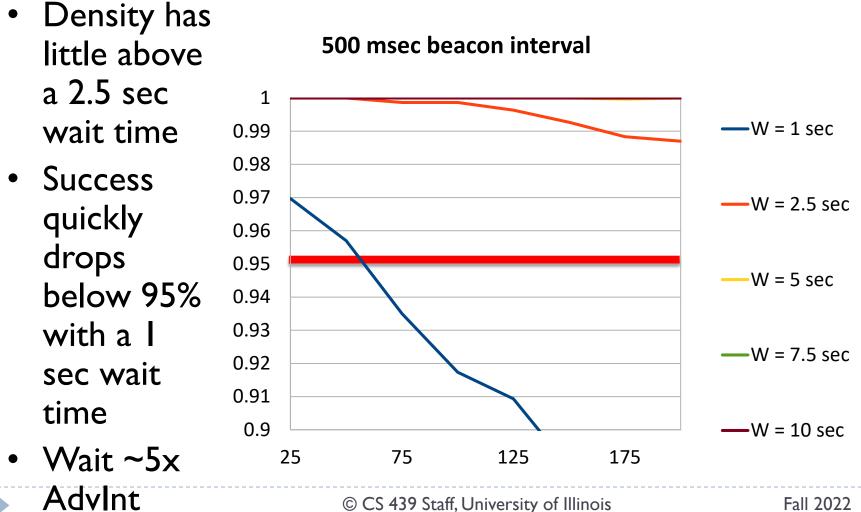

- Number of tags: 25-200
- Beacon interval: Is, 500ms, 250ms, 100ms

#### Metric

- t Sec Success: are all packets from the train received in t sec?
- Discrete Event Simulator
  - ns-3: No true BLE
  - Based on Zigbee PHY layer adapted to IMbps channel

- Density has little effect above a 5 sec wait time
- Success is still over **95%** with a 2.5 sec wait time
- Wait ~2.5x AdvInt

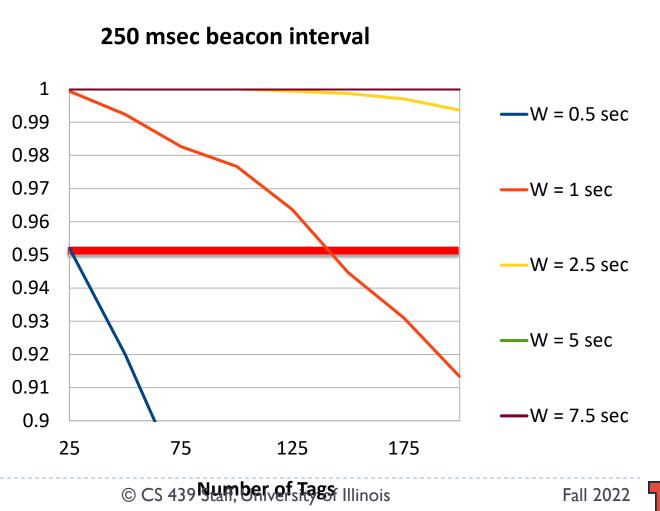

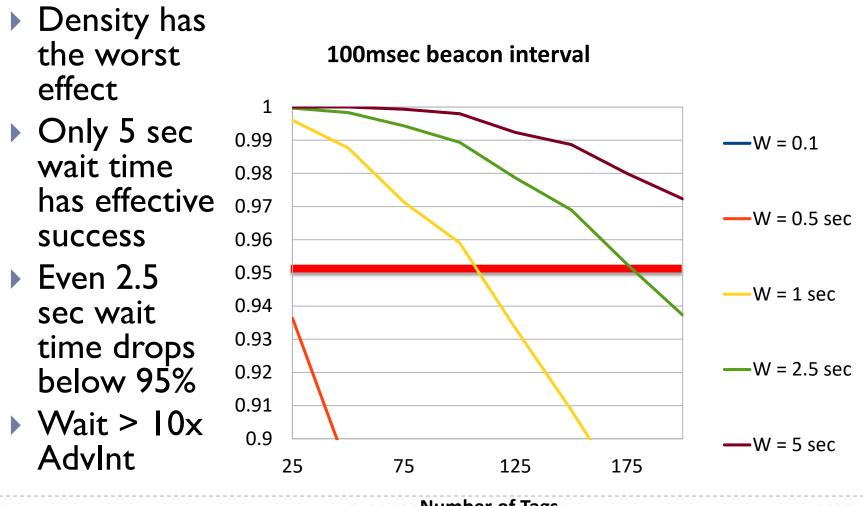

Fall 2022

- Density has more effect, reducing the success of I sec wait time
- Success is almost always below 95% with a 0.5 sec wait time

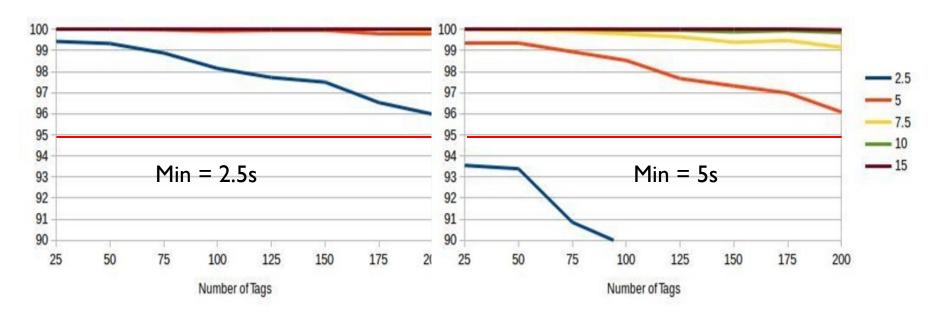

© CS 439 Stam, berverstages Illinois

Fall 2022

#### Beacon Train Success - 1 sec BI

N = I

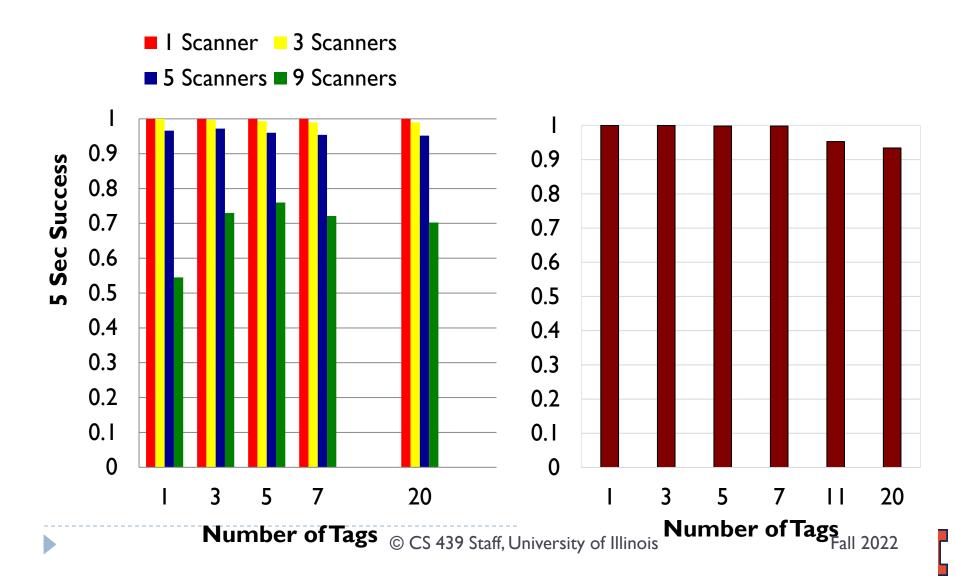

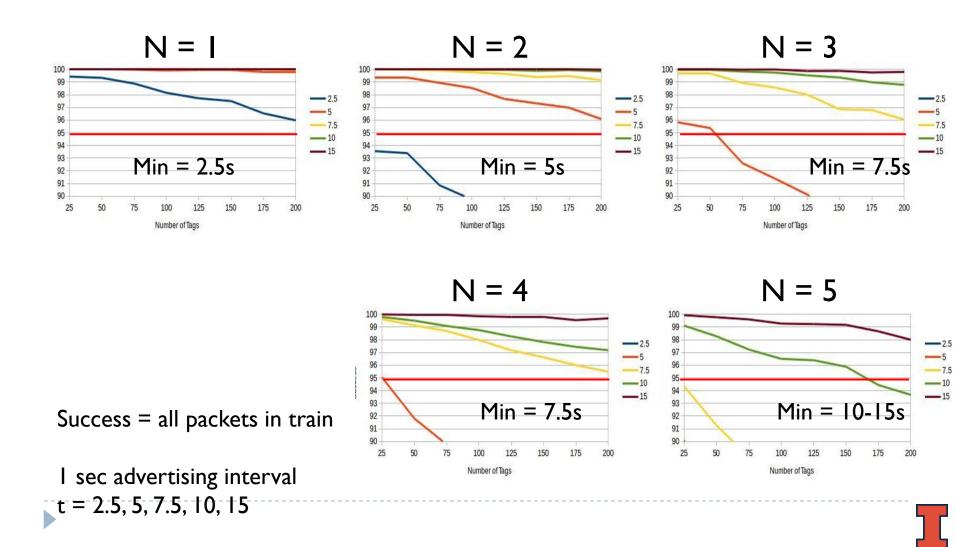

Success = all packets in train

l sec advertising interval t = 2.5, 5, 7.5, 10, 15

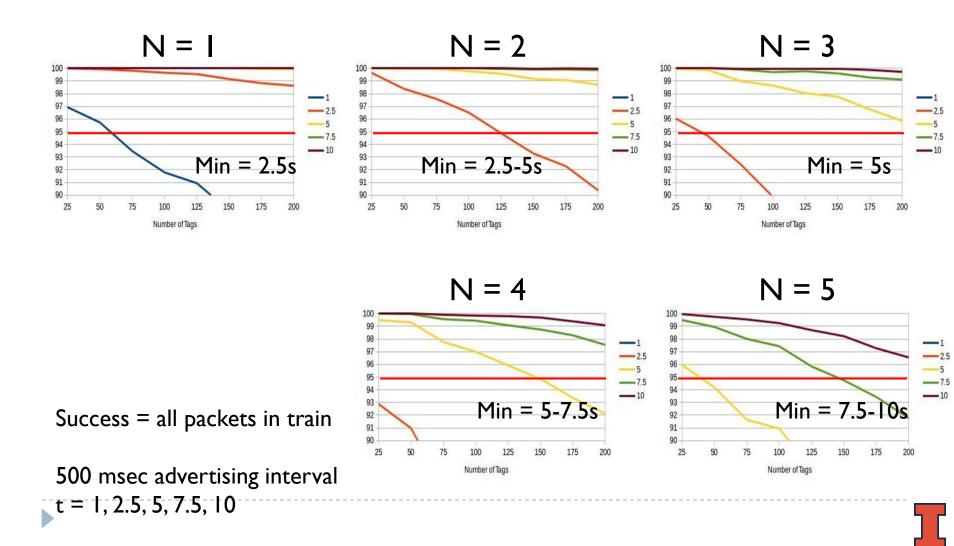

# Active Scanning vs. N=2 Beacon Trains (experimental results)

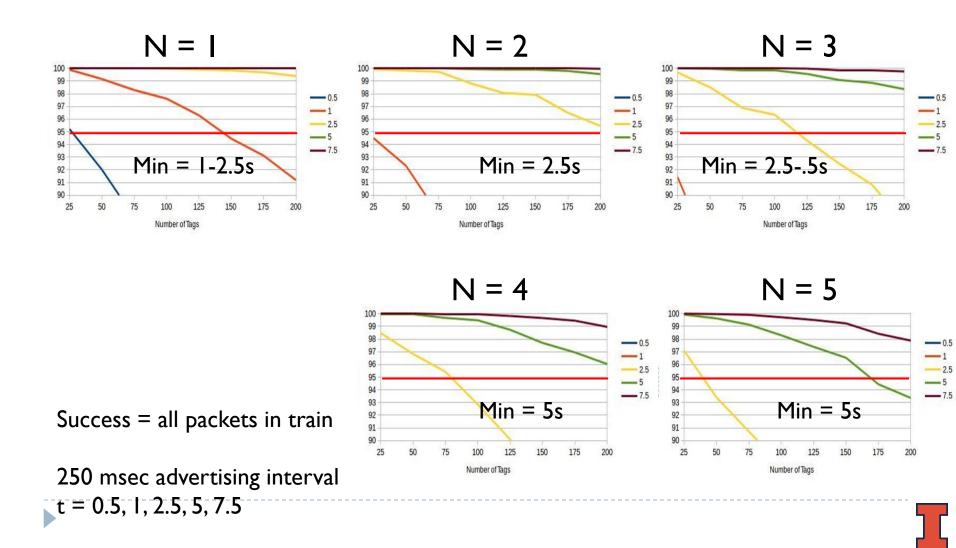

#### Beacon Train Success - 1 sec BI

#### Beacon Train Success - 500 msec BI

#### Beacon Train Success - 250 msec BI

#### Beacon Train Success - 100 msec BI
