

Midterm Review

Magritte, *Homesickness*

Computational Photography

Derek Hoiem, University of Illinois

Major Topics

- **Linear Filtering**
 - How it works
 - Template and Frequency interpretations
 - Image pyramids and their applications
 - Sampling (Nyquist theorem, application of low-pass filtering)
- **Light and color**
 - Lambertian shading, shadows, specularities
 - Color spaces (RGB, HSV, LAB)
 - Image-based lighting
- **Techniques**
 - Finding boundaries: intelligent scissors, graph cuts, where to cut and why
 - Texture synthesis: idea of sampling patches to synthesize, filling order
 - Compositing and blending: alpha compositing, Laplacian blending, Poisson editing
- **Warping**
 - Transformation matrices, homogeneous coordinates, solving for parameters via system of linear equations
- **Modeling shape**
 - Averaging and interpolating sets of points

Major Topics

- **Camera models and Geometry**

- Pinhole model: diagram, intrinsic/extrinsic matrices, camera center (or center of projection), image plane
- Focal length, depth of field, field of view, aperture size
- Vanishing points and vanishing lines (what they are, how to find them)
- Measuring relative lengths based on vanishing points and horizon

- **Interest points**

- Trade-offs between repeatability and distinctiveness for detectors and descriptors
- Harris (corner) detectors and Difference of Gaussian (blob) detectors
- SIFT representation: what transformations is it robust to or not robust to

- **Image stitching**

- Solving for homography
- RANSAC for robust detection of inliers

- **Object recognition and search**

- Use of “visual words” to speed search
- Idea of geometric verification to check that points have consistent geometry

- **Other camera systems**

- Kinect, lightfield camera, synthetic aperture --- how do they work?

Studying for Midterm

- Roughly 80% is related to topics in bold (linear filtering, warping, camera models, lighting, and geometry)
- No book, no notes, no computers/calculators allowed
- Bring a pencil or pen

Logistics

- Section C: take exam in DCL 1320 Thurs 9:30
- Section D (overflow): take exam in Siebel Center 1111 Thurs 9:30
 - See names on right
- Conflict exam
 - Wed 11/29 in Siebel Center 1312 at 3-4:30pm

Section D4 has 6 students

Today's review

1. Light
2. Camera capture and geometry
3. Image filtering
4. Region selection and compositing
5. Solving for transformations

Purposes

- Remind you of key concepts
- Chance for you to ask questions

1. Light and color

- Lighting
 - Lambertian shading, shadows, specularities
 - Color spaces (RGB, HSV, LAB)

How is light reflected from a surface?

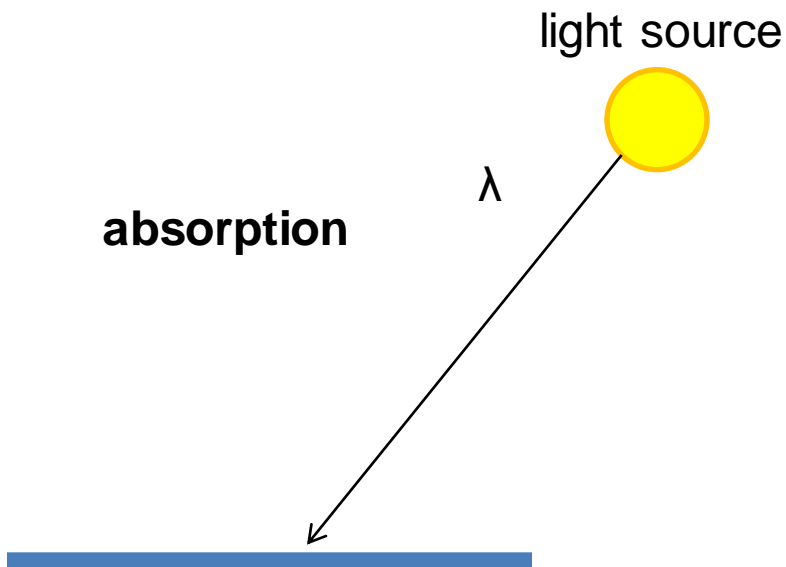

Depends on

- Illumination properties: wavelength, orientation, intensity
- Surface properties: material, surface orientation, roughness, etc.

Lambertian surface

- Some light is absorbed (function of albedo)
- Remaining light is reflected equally in all directions (diffuse reflection)
- Examples: soft cloth, concrete, matte paints

Diffuse reflection

Intensity *does* depend on illumination angle because less light comes in at oblique angles.

ρ = albedo

\mathbf{S} = directional source

\mathbf{N} = surface normal

I = image intensity

$$I(x) = \rho(x)(\mathbf{S} \cdot \mathbf{N}(x))$$

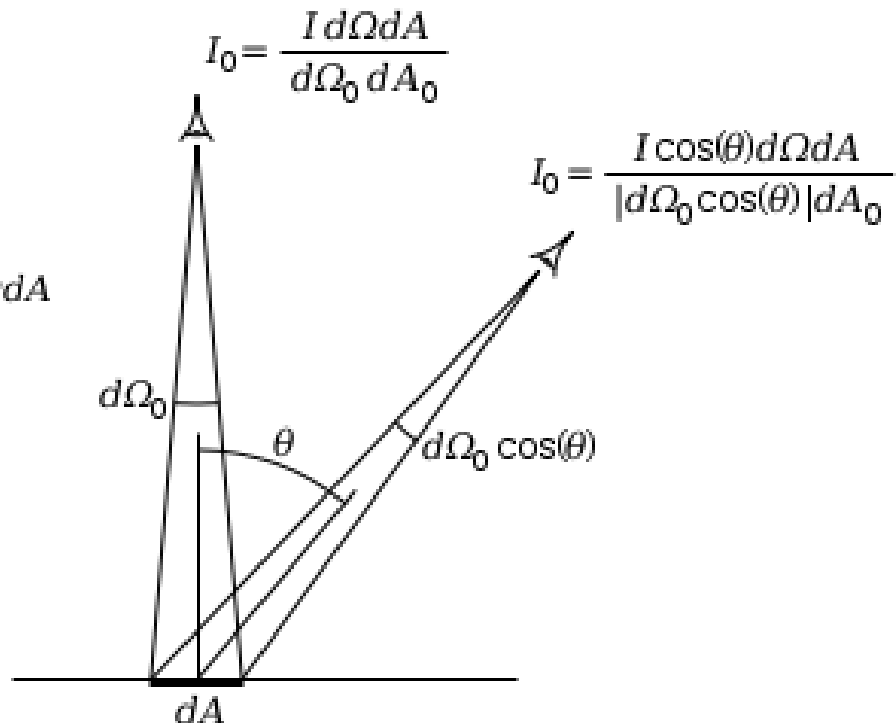

Diffuse reflection

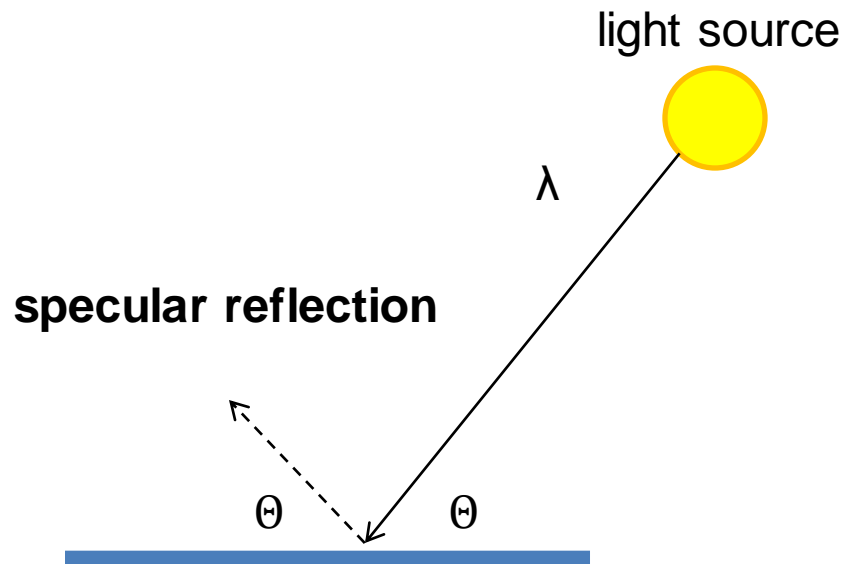

Perceived intensity does *not* depend on viewer angle.

- Amount of reflected light proportional to $\cos(\theta)$
- Visible solid angle also proportional to $\cos(\theta)$

Specular Reflection

- Reflected direction depends on light orientation and surface normal
- E.g., mirrors are mostly specular

Flickr, by suzysputnik

Flickr, by piratejohnny

Many surfaces have both specular and diffuse components

- Specularity = spot where specular reflection dominates (typically reflects light source)

Questions

1.

- A. For each of the arrows in the above image, name the reasons the pixel near the end of the arrow has its brightness value and explain very briefly. The arrow pointing to milk is pointing to the thin bright line at the edge of the piece of apple; the arrow pointing to the spoon handle is pointing to the bright area on the handle.

Possible factors: albedo, shadows, texture, specularities, curvature, lighting direction

Discretization

- Because pixel grid is discrete, pixel intensities are determined by a range of scene points

FIGURE 3.15 Four basic image types: dark, light, low contrast, high contrast, and their corresponding histograms. (Original image courtesy of Dr. Roger Heady, Research School of Biological Sciences, Australian National University, Canberra, Australia.)

Contrast enhancement / balancing

- Gamma correction

$$V_{\text{new}} = v_{\text{old}}^\gamma$$

- Histogram equalization

FIGURE 3.6 Plots of the equation $s = cr^\gamma$ for various values of γ ($c = 1$ in all cases).

Cumulative Histograms

2. Camera Capture and Geometry

Pinhole Camera

Useful figure to remember

Projection Matrix

$$\mathbf{x} = \mathbf{K}[\mathbf{R} \quad \mathbf{t}] \mathbf{X} \rightarrow_w \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = \begin{bmatrix} f & s & u_0 \\ 0 & cf & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} r_{11} & r_{12} & r_{13} & t_x \\ r_{21} & r_{22} & r_{23} & t_y \\ r_{31} & r_{32} & r_{33} & t_z \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

Single-view metrology

Assume the man is 6 ft tall.

- What is the height of the building?
- How long is the right side of the building compared to the small window on the right side of the building?

cross-ratio

$$\frac{\| \mathbf{P}_3 - \mathbf{P}_1 \| \| \mathbf{P}_4 - \mathbf{P}_2 \|}{\| \mathbf{P}_3 - \mathbf{P}_2 \| \| \mathbf{P}_4 - \mathbf{P}_1 \|}$$

Adding a lens

- A lens focuses light onto the film
 - There is a specific distance at which objects are “in focus”
 - other points project to a “circle of confusion” in the image
 - Changing the shape of the lens changes this distance

Focal length, aperture, depth of field

- A lens focuses parallel rays onto a single focal point
- focal point at a distance f beyond the plane of the lens
 - Aperture of diameter D restricts the range of rays

The aperture and depth of field

$f/5.6$

$f/32$

Main way to increase depth of field: Decrease aperture size

F-number ($f/\#$) = $\text{focal_length} / \text{aperture_diameter}$

- E.g., $f/16$ means that the focal length is 16 times the diameter
- When you set the f-number of a camera, you are setting the aperture

The Photographer's Great Compromise

What we want

How we get it

Cost

More spatial resolution

Increase focal length

Light, FOV

Decrease focal length

DOF

Broader field of view

Decrease aperture

Light

More depth of field

Increase aperture

DOF

More temporal resolution

Shorten exposure

Light

Lengthen exposure

Temporal Res

More light

3. Linear filtering

- Can think of filtering as
 - A function in the spatial domain (e.g., compute average of each 3x3 window)
 - Template matching
 - Modifying the frequency of the image

Filtering in spatial domain

1	0	-1
2	0	-2
1	0	-1

intensity image

Filtering in frequency domain

- Can be faster than filtering in spatial domain (for large filters)
- Can help understand effect of filter
- Algorithm:
 1. Convert image and filter to fft (fft2 in matlab)
 2. Pointwise-multiply ffts
 3. Convert result to spatial domain with ifft2

Filtering in frequency domain

FFT

\times

$=$

FFT

Inverse FFT

Filtering in frequency domain

- Linear filters for basic processing
 - Edge filter (high-pass)
 - Gaussian filter (low-pass)

$[-1 \ 1]$

FFT of Gradient Filter

FFT of Gaussian

Gaussian

Filtering

Why does the Gaussian give a nice smooth image, but the square filter give edgy artifacts?

Gaussian

Box filter

Gaussian

filter: gaussian

filtered image

log fit magnitude of image

filter: gaussian

log fit magnitude of filtered image

Box Filter

Question

1. Use filtering to find pixels that have at least three white pixels among the 8 surrounding pixels (assume a binary image)

2. Write down a filter that will compute the following function

$$\text{fil}(y, x) = -0.5 * \text{im}(y+1, x) + \text{im}(y, x) - 0.5 * \text{im}(y-1, x)$$

for each x, y

Question

3. Fill in the blanks:

Filtering Operator

a) $_ = D * B$

b) $A = _ * _$

c) $F = D * _$

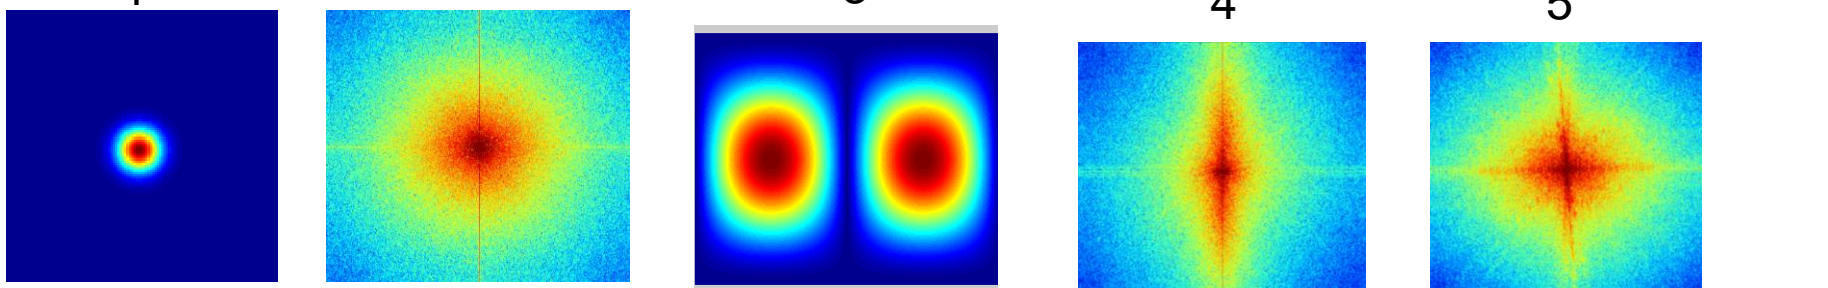

d) $_ = D * C$

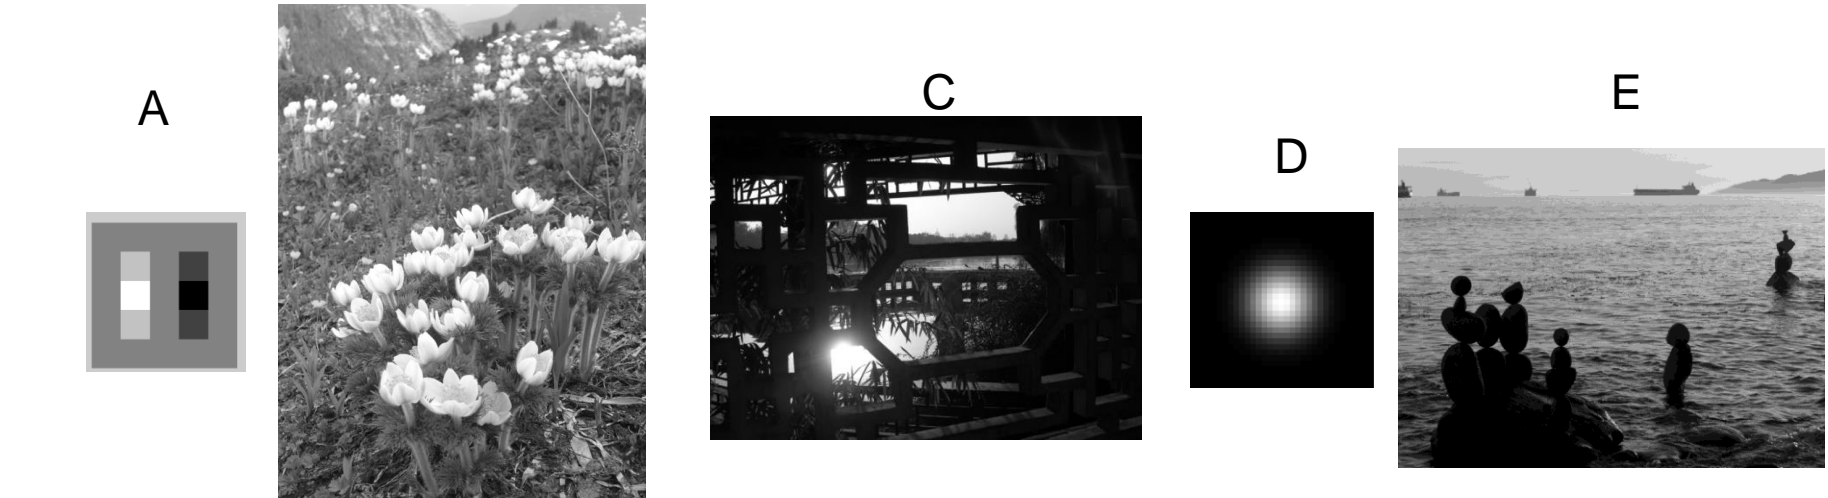

Question

1. Match the spatial domain image to the Fourier magnitude image

1 2 3 4 5

A B C D E

The image displays five Fourier magnitude images (labeled 1 through 5) and five corresponding spatial domain images (labeled A through E). The task is to match each spatial domain image to its corresponding Fourier magnitude image.

- Image 1:** A single central peak, indicating a spatial domain image with a single point or a very small, localized feature.
- Image 2:** A central peak with a vertical line, indicating a spatial domain image with a vertical edge or a feature that is symmetric about the vertical axis.
- Image 3:** Two side peaks, indicating a spatial domain image with two distinct, localized features.
- Image 4:** A vertical line, indicating a spatial domain image with a vertical edge or a feature that is symmetric about the vertical axis.
- Image 5:** A central peak with a cross, indicating a spatial domain image with a central feature and four symmetric features.

The spatial domain images are:

- A:** A 2x2 grayscale checkerboard pattern.
- B:** A grayscale image of a field of white tulips.
- C:** A grayscale image of a dark scene with a bright light source (possibly a window) and a railing.
- D:** A grayscale image showing a blurred central spot.
- E:** A grayscale image of a group of people sitting on a rocky shore near the water.

Matching with filters

- Goal: find  in image
- Method 2: SSD

$$h[m,n] = \sum_{k,l} (g[k,l] - f[m+k,n+l])^2$$

Input

1- sqrt(SSD)

Thresholded Image

Matching with filters

- Goal: find  in image
- Method 3: Normalized cross-correlation

$$h[m,n] = \frac{\sum_{k,l} (g[k,l] - \bar{g})(f[m-k, n-l] - \bar{f}_{m,n})}{\left(\sum_{k,l} (g[k,l] - \bar{g})^2 \sum_{k,l} (f[m-k, n-l] - \bar{f}_{m,n})^2 \right)^{0.5}}$$

mean template mean image patch

↓ ↓

Matlab: `normxcorr2(template, im)`

Matching with filters

- Goal: find  in image
- Method 3: Normalized cross-correlation

Input

Normalized X-Correlation

Thresholded Image

Subsampling by a factor of 2

Throw away every other row and column to create a 1/2 size image

Problem: This approach causes “aliasing”

Nyquist-Shannon Sampling Theorem

- When sampling a signal at discrete intervals, the sampling frequency must be $\geq 2 \times f_{\max}$
- f_{\max} = max frequency of the input signal
- This will allow to reconstruct the original perfectly from the sampled version

Algorithm for downsampling by factor of 2

1. Start with image(h, w)

2. Apply low-pass filter

```
im_blur = imfilter(image, fspecial('gaussian', 13, 2))
```

3. Sample every other pixel

```
im_small = im_blur(1:2:end, 1:2:end);
```

Subsampling without pre-filtering

1/2

1/4 (2x zoom)

1/8 (4x zoom)

Subsampling with Gaussian pre-filtering

Gaussian $1/2$

G $1/4$

G $1/8$

Sampling

Why does a lower resolution image still make sense to us? What do we lose?

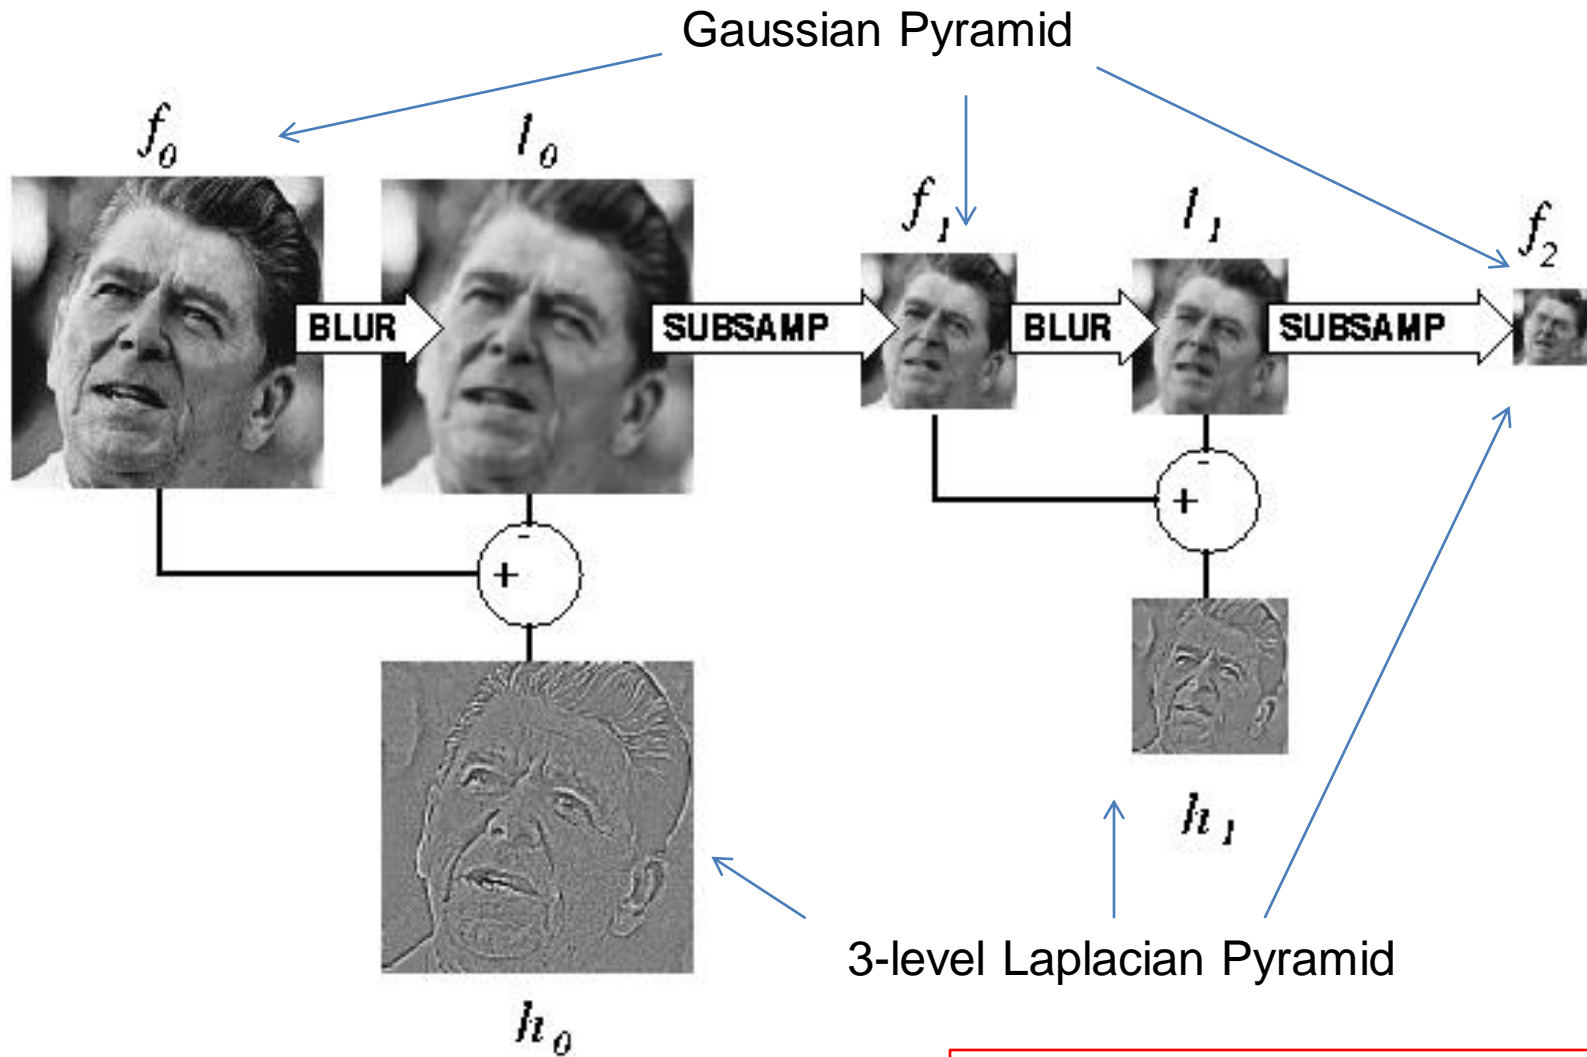

Gaussian pyramid

- Useful for coarse-to-fine matching
- Applications include multi-scale object detection, image alignment, optical flow, point tracking

Computing Gaussian/Laplacian Pyramid

Useful figure to remember

Image reconstruction from Laplacian pyramid

4. Region selection and compositing

- Selecting image regions
 - Intelligent scissors
 - Graph cuts
- Compositing
 - Alpha masks
 - Feathering
 - Laplacian pyramid blending
 - Poisson blending

Intelligent Scissors

- You can treat the image as a graph
 - Nodes = pixels, edges connect neighboring pixels

Intelligent Scissors: Good boundaries are a short (high gradient) path through the graph

Graph Cuts

- You can treat the image as a graph
 - Nodes = pixels, edges connect neighboring pixels

Graph cut: Good boundaries are a cheap cut, where some pixels want to be foreground, and some to be background

Compositing and Blending

- Feathering: blur mask around its edges
- Laplacian blending: blend low-frequency slowly, high frequency quickly
 - Blend with alpha mask values ranging from 0 to 1

(l)

Question

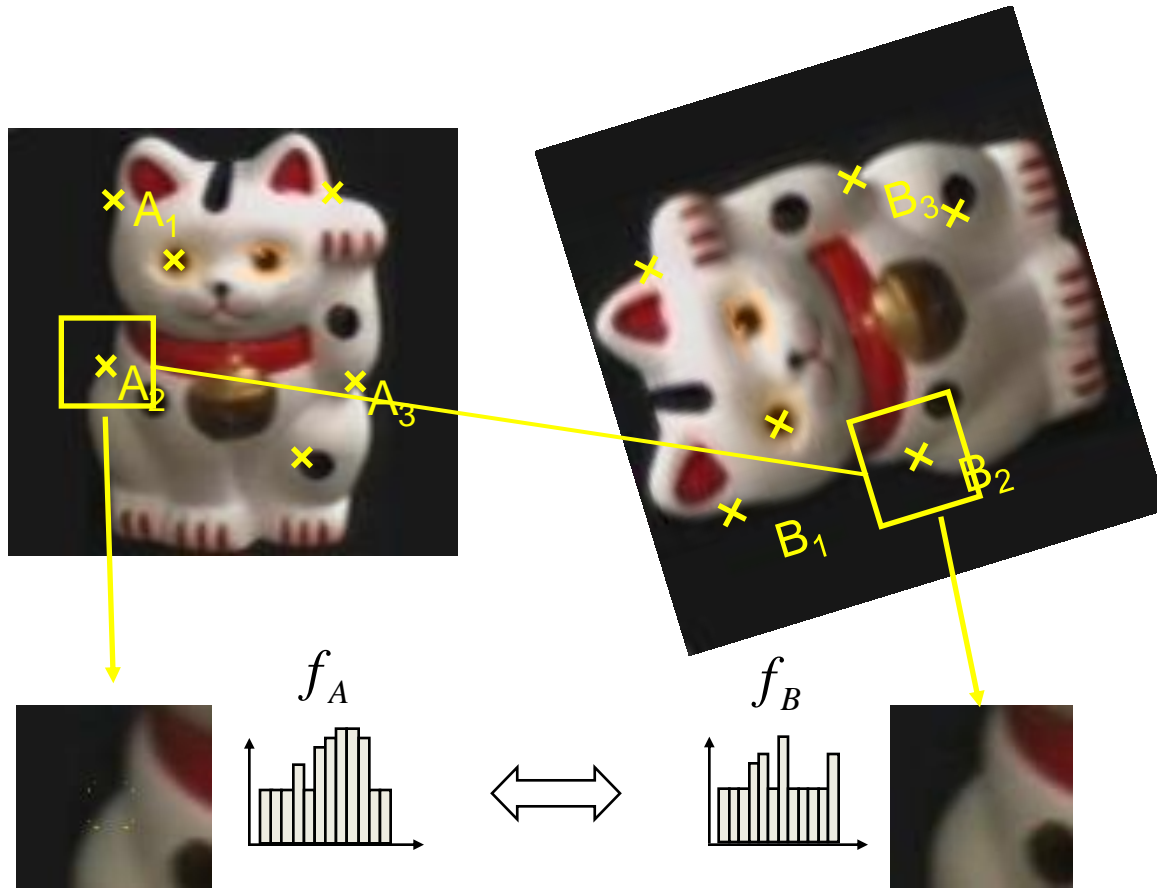

1) I am trying to blend this bear into this pool.

What problems will I have if I use:

- a) Alpha compositing with feathering
- b) Laplacian pyramid blending
- c) Poisson editing?

Keypoint Matching

1. Find a set of distinctive keypoints
2. Define a region around each keypoint
3. Extract and normalize the region content
4. Compute a local descriptor from the normalized region
5. Match local descriptors

Key trade-offs

Localization

More Points

Robust to occlusion
Works with less texture

More Repeatable

Robust detection
Precise localization

Description

More Robust

Deal with expected variations
Maximize correct matches

More Selective

Minimize wrong matches

Harris Detector [Harris88]

- Second moment matrix

$$\mu(\sigma_I, \sigma_D) = g(\sigma_I) * \begin{bmatrix} I_x^2(\sigma_D) & I_x I_y(\sigma_D) \\ I_x I_y(\sigma_D) & I_y^2(\sigma_D) \end{bmatrix}$$

$$\det M = \lambda_1 \lambda_2$$

$$\text{trace } M = \lambda_1 + \lambda_2$$

2. Square of derivatives

3. Gaussian filter $g(\sigma_I)$

4. Cornerness function – both eigenvalues are strong

$$har = \det[\mu(\sigma_I, \sigma_D)] - \alpha [\text{trace}(\mu(\sigma_I, \sigma_D))]^2 =$$

$$g(I_x^2)g(I_y^2) - [g(I_x I_y)]^2 - \alpha [g(I_x^2) + g(I_y^2)]^2$$

5. Non-maxima suppression

1. Image derivatives

Harris Detector – Responses [Harris88]

Effect: A very precise corner detector.

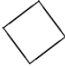

Applications

- Image stitching
 - Matching keypoints
 - Solving for homography
 - RANSAC
- Object recognition
 - Clustering keypoints and creating tf-idf tables for fast retrieval
 - Geometric verification

5. Solving for transformations

- Map between 2D coordinates using linear projection

Name	Matrix	# D.O.F.	Preserves:	Icon
translation	$\begin{bmatrix} I & & t \end{bmatrix}_{2 \times 3}$	2	orientation + ...	
rigid (Euclidean)	$\begin{bmatrix} R & & t \end{bmatrix}_{2 \times 3}$	3	lengths + ...	
similarity	$\begin{bmatrix} sR & & t \end{bmatrix}_{2 \times 3}$	4	angles + ...	
affine	$\begin{bmatrix} A \end{bmatrix}_{2 \times 3}$	6	parallelism + ...	
projective	$\begin{bmatrix} \tilde{H} \end{bmatrix}_{3 \times 3}$	8	straight lines	

Least-squares Solving

- If all points (or correspondences) fit the model with some noise, better to use all for least squares estimate

Least-squares Solving

- If some points are outliers, robust approach such as RANSAC is needed

Question

Suppose we have two triangles, ABC and DEF, related by a general affine transformation. Solve for the transformation.

Good luck!

- Questions?

Take-home questions

- 2) How would you make a sharpening filter using gradient domain processing? What are the constraints on the gradients and the intensities?

Take-home question

Suppose you have estimated three vanishing points corresponding to orthogonal directions. How can you recover the rotation matrix that is aligned with the 3D axes defined by these points?

- Assume that intrinsic matrix K has three parameters
- Remember, in homogeneous coordinates, we can write a 3d point at infinity as $(X, Y, Z, 0)$
