# More Dynamic Programming

Lecture 9 February 17, 2011

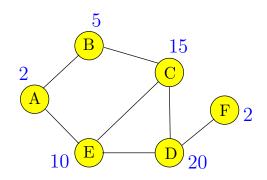

## Part I

Maximum Weighted Independent Set in Trees

# Maximum Weight Independent Set Problem

Input Graph  $\textit{\textbf{G}} = (\textit{\textbf{V}}, \textit{\textbf{E}})$  and weights  $\textit{\textbf{w}}(\textit{\textbf{v}}) \geq 0$  for each  $\textit{\textbf{v}} \in \textit{\textbf{V}}$ 

Goal Find maximum weight independent set in G

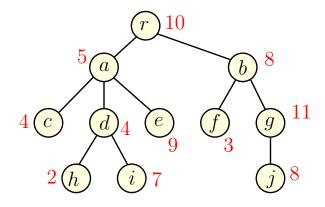

Maximum weight independent set in above graph:  $\{B, D\}$ 

Sariel (UIUC) CS473 3 Fall 2011 3 / 42

## Maximum Weight Independent Set in a Tree

Input Tree T = (V, E) and weights  $w(v) \ge 0$  for each  $v \in V$  Goal Find maximum weight independent set in T

Maximum weight independent set in above tree: ??

## Towards a Recursive Solution

For an arbitrary graph G:

- Number vertices as  $v_1, v_2, \ldots, v_n$
- Find recursively optimum solutions without  $\mathbf{v}_n$  (recurse on  $\mathbf{G} \mathbf{v}_n$ ) and with  $\mathbf{v}_n$  (recurse on  $\mathbf{G} \mathbf{v}_n \mathbf{N}(\mathbf{v}_n)$  & include  $\mathbf{v}_n$ ).
- Saw that if graph G is arbitrary there was no good ordering that resulted in a small number of subproblems.

What about a tree? Natural candidate for  $\mathbf{v}_n$  is root  $\mathbf{r}$  of  $\mathbf{T}$ ?

Sariel (UIUC) CS473 5 Fall 2011 5 / 43

## Towards a Recursive Solution

Natural candidate for  $v_n$  is root r of T? Let  $\mathcal{O}$  be an optimum solution to the whole problem.

Case  $r \notin \mathcal{O}$ : Then  $\mathcal{O}$  contains an optimum solution for each subtree of T hanging at a child of r.

Case  $r \in \mathcal{O}$ : None of the children of r can be in  $\mathcal{O}$ .  $\mathcal{O} - \{r\}$  contains an optimum solution for each subtree of T hanging at a grandchild of r.

Subproblems? Subtrees of **T** hanging at nodes in **T**.

#### A Recursive Solution

T(u): subtree of T hanging at node u OPT(u): max weighted independent set value in T(u)

$$OPT(u) = \max \begin{cases} \sum_{v \text{ child of } u} OPT(v), \\ w(u) + \sum_{v \text{ grandchild of } u} OPT(v) \end{cases}$$

# Iterative Algorithm

- Compute OPT(u) bottom up. To evaluate OPT(u) need to have computed values of all children and grandchildren of u
- What is an ordering of nodes of a tree *T* to achieve above?
   Post-order traversal of a tree.

## Iterative Algorithm

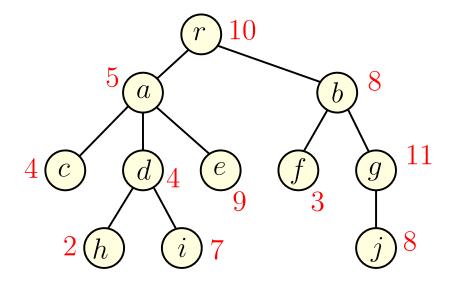

# $\begin{aligned} & \text{MIS-Tree}(\textit{\textbf{T}}): \\ & \text{Let } \textit{\textbf{v}}_1, \textit{\textbf{v}}_2, \ldots, \textit{\textbf{v}}_n \text{ be a post-order traversal of nodes of T} \\ & \text{for } \textit{\textbf{i}} = 1 \text{ to } \textit{\textbf{n}} \text{ do} \\ & \textit{\textbf{M}}[\textit{\textbf{v}}_i] = \max \Bigl( \sum_{\textit{\textbf{v}}_j \text{ child of } \textit{\textbf{v}}_i} \textit{\textbf{M}}[\textit{\textbf{v}}_j], \quad \textit{\textbf{w}}(\textit{\textbf{v}}_i) + \sum_{\textit{\textbf{v}}_j \text{ grandchild of } \textit{\textbf{v}}_i} \textit{\textbf{M}}[\textit{\textbf{v}}_j] \Bigr) \\ & \text{\textbf{return }} \textit{\textbf{M}}[\textit{\textbf{v}}_n] \text{ (* Note: } \textit{\textbf{v}}_n \text{ is the root of } \textit{\textbf{T}} \text{ *)} \end{aligned}$

Space: O(n) to store the value at each node of T Running time:

- Naive bound:  $O(n^2)$  since each  $M[v_i]$  evaluation may take O(n) time and there are n evaluations.
- Better bound: O(n). A value  $M[v_j]$  is accessed only by its parent and grand parent.

Sariel (UIUC) CS473 9 Fall 2011 9 / 42

## Example

Sariel (UIUC) CS473 10 Fall 2011 10 / 4

#### Part II

# DAGs and Dynamic Programming

Sariel (UIUC) CS473 11 Fall 2011 11 / 42

## Recursion and DAGs

#### Observation

Let **A** be a recursive algorithm for problem  $\Pi$ . For each instance **I** of  $\Pi$  there is an associated DAG G(I).

- Create directed graph G(I) as follows...
- For each sub-problem in the execution of **A** on **I** create a node.
- If sub-problem  $\mathbf{v}$  depends on or recursively calls sub-problem  $\mathbf{u}$  add directed edge  $(\mathbf{u}, \mathbf{v})$  to graph.
- G(I) is a DAG. Why? If G(I) has a cycle then A will not terminate on I.

# Iterative Algorithm for...

Dynamic Programming and DAGs

#### Observation

An iterative algorithm **B** obtained from a recursive algorithm **A** for a problem  $\Pi$  does the following:

For each instance I of  $\Pi$ , it computes a topological sort of G(I) and evaluates sub-problems according to the topological ordering.

- Sometimes the  $\overline{DAG}$  G(I) can be obtained directly without thinking about the recursive algorithm A
- In some cases (not all) the computation of an optimal solution reduces to a shortest/longest path in DAG G(I)
- Topological sort based shortest/longest path computation is dynamic programming!

Sariel (UIUC) CS473 13 Fall 2011 13 / 42

# A quick reminder...

A Recursive Algorithm for weighted interval scheduling

Let  $O_i$  be value of an optimal schedule for the first i jobs.

```
\begin{aligned} &\text{Schedule}(\textit{n}): \\ &\text{if } \textit{n} = 0 \text{ then return } 0 \\ &\text{if } \textit{n} = 1 \text{ then return } \textit{w}(\textit{v}_1) \\ &\textit{O}_{\textit{p}(\textit{n})} \leftarrow \text{Schedule}(\textit{p}(\textit{n})) \\ &\textit{O}_{\textit{n}-1} \leftarrow \text{Schedule}(\textit{n}-1) \\ &\text{if } (\textit{O}_{\textit{p}(\textit{n})} + \textit{w}(\textit{v}_\textit{n}) < \textit{O}_{\textit{n}-1}) \text{ then} \\ &\textit{O}_{\textit{n}} = \textit{O}_{\textit{n}-1} \\ &\text{else} \\ &\textit{O}_{\textit{n}} = \textit{O}_{\textit{p}(\textit{n})} + \textit{w}(\textit{v}_\textit{n}) \\ &\text{return } \textit{O}_{\textit{n}} \end{aligned}
```

Sariel (UIUC) CS473 14 Fall 2011 14 / 4

# Weighted Interval Scheduling via...

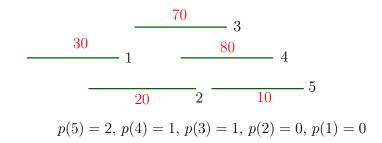

Longest Path in a DAG

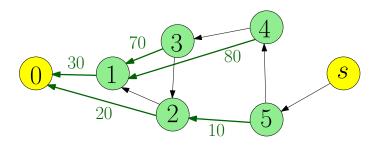

Given intervals, create a DAG as follows:

- Create one node for each interval, plus a dummy sink node  $\mathbf{0}$  for interval  $\mathbf{0}$ , plus a dummy source node  $\mathbf{s}$ .
- For each interval i add edge (i, p(i)) of the length/weight of  $v_i$ .
- Add an edge from s to n of length 0.
- For each interval i add edge (i, i 1) of length 0.

Sariel (UIUC) CS473 15 Fall 2011 15 / 42

# Example

Sariel (UIUC) CS473 16 Fall 2011 16 / 42

# Relating Optimum Solution

Given interval problem instance I let G(I) denote the DAG constructed as described.

#### Claim

Optimum solution to weighted interval scheduling instance I is given by longest path from s to 0 in G(I).

Assuming claim is true,

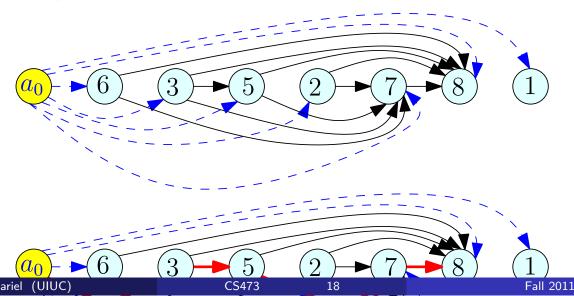

- If I has n intervals, DAG G(I) has n+2 nodes and O(n) edges. Creating G(I) takes  $O(n \log n)$  time: to find p(i) for each i. How?
- Longest path can be computed in O(n) time recall O(m+n) algorithm for shortest/longest paths in DAGs.

Sariel (UIUC) CS473 17 Fall 2011 17 / 42

## DAG for Longest Increasing Sequence

Given sequence  $a_1, a_2, \ldots, a_n$  create DAG as follows:

- add sentinel  $a_0$  to sequence where  $a_0$  is less than smallest element in sequence
- for each *i* there is a node *v<sub>i</sub>*
- if i < j and  $a_i < a_j$  add an edge  $(v_i, v_j)$
- find longest path from **v**<sub>0</sub>

#### Part III

# Edit Distance and Sequence Alignment

Sariel (UIUC) CS473 19 Fall 2011 19 / 42

# Spell Checking Problem

Given a string "exponen" that is not in the dictionary, how should a spell checker suggest a *nearby* string?

What does nearness mean?

Question: Given two strings  $x_1x_2...x_n$  and  $y_1y_2...y_m$  what is a distance between them?

Edit Distance: minimum number of "edits" to transform x into y.

## **Edit Distance**

#### Definition

Edit distance between two words X and Y is the number of letter insertions, letter deletions and letter substitutions required to obtain Y from X.

## Example

The edit distance between FOOD and MONEY is at most 4:

$$FOOD \rightarrow MOOD \rightarrow MONOD \rightarrow MONED \rightarrow MONEY$$

Sariel (UIUC) CS473 21 Fall 2011 21 / 42

## Edit Distance: Alternate View

## Alignment

Place words one on top of the other, with gaps in the first word indicating insertions, and gaps in the second word indicating deletions.

$$egin{array}{ccccccc} F & O & O & D \\ M & O & N & E & Y \end{array}$$

Formally, an alignment is a set M of pairs (i,j) such that each index appears at most once, and there is no "crossing": i < i' and i is matched to j implies i' is matched to j' > j. In the above example, this is  $M = \{(1,1), (2,2), (3,3), (4,5)\}$ . Cost of an alignment is the number of mismatched columns plus number of unmatched indices in both strings.

## Edit Distance Problem

### Problem

Given two words, find the edit distance between them, i.e., an alignment of smallest cost.

Sariel (UIUC) CS473 23 Fall 2011 23 / 42

# **Applications**

- Spell-checkers and Dictionaries
- Unix diff
- DNA sequence alignment ... but, we need a new metric

Sariel (UIUC) CS473 24 Fall 2011 24 / 4

# Similarity Metric

#### Definition

For two strings X and Y, the cost of alignment M is

- ullet [Gap penalty] For each gap in the alignment, we incur a cost  $\delta$ .
- [Mismatch cost] For each pair p and q that have been matched in M, we incur cost  $\alpha_{pq}$ ; typically  $\alpha_{pp} = 0$ .

Edit distance is special case when  $\delta = \alpha_{pq} = 1$ .

Sariel (UIUC) CS473 25 Fall 2011 25 / 42

# An Example

#### Example

Alternative:

Or a really stupid solution (delete string, insert other string):

 $\mathsf{Cost} = \mathbf{19} \boldsymbol{\delta}.$ 

# Sequence Alignment

Input Given two words  $\pmb{X}$  and  $\pmb{Y}$ , and gap penalty  $\pmb{\delta}$  and mismatch costs  $\alpha_{pq}$ 

Goal Find alignment of minimum cost

## Edit distance

Basic observation

Let  $\mathbf{X} = \alpha \mathbf{x}$  and  $\mathbf{Y} = \beta \mathbf{y}$ 

 $\alpha, \beta$ : stings.

x and y single characters.

Think about optimal edit distance between  $\boldsymbol{X}$  and  $\boldsymbol{Y}$  as alignment, and consider last column of alignment of the two strings:

$\alpha$	X
$oldsymbol{eta}$	y

or

$\alpha$	X
$\beta y$	

or

$\alpha x$	
$oldsymbol{eta}$	y

#### Observation

Prefixes must have optimal alignment!

## Problem Structure

#### Observation

Let  $X = x_1 x_2 \cdots x_m$  and  $Y = y_1 y_2 \cdots y_n$ . If (m, n) are not matched then either the mth position of X remains unmatched or the nth position of Y remains unmatched.

- Case  $x_m$  and  $y_n$  are matched.
  - Pay mismatch cost  $\alpha_{x_m y_n}$  plus cost of aligning strings  $x_1 \cdots x_{m-1}$  and  $y_1 \cdots y_{n-1}$
- Case  $x_m$  is unmatched.
  - Pay gap penalty plus cost of aligning  $x_1 \cdots x_{m-1}$  and  $y_1 \cdots y_n$
- Case  $y_n$  is unmatched.
  - ullet Pay gap penalty plus cost of aligning  $x_1 \cdots x_m$  and  $y_1 \cdots y_{n-1}$

Sariel (UIUC) CS473 29 Fall 2011 29 / 42

## Subproblems and Recurrence

#### **Optimal Costs**

Let  $\mathrm{Opt}(i,j)$  be optimal cost of aligning  $x_1 \cdots x_i$  and  $y_1 \cdots y_j$ . Then

Base Cases:  $\mathrm{Opt}(\emph{\textbf{i}},0) = \delta \cdot \emph{\textbf{i}}$  and  $\mathrm{Opt}(0,\emph{\textbf{j}}) = \delta \cdot \emph{\textbf{j}}$ 

# Dynamic Programming Solution

$$\begin{aligned} &\text{for all } \textit{i} \text{ do } \textit{M}[\textit{i},0] = \textit{i}\delta \\ &\text{for all } \textit{j} \text{ do } \textit{M}[0,\textit{j}] = \textit{j}\delta \end{aligned} \\ &\text{for } \textit{i} = 1 \text{ to } \textit{m} \text{ do} \\ &\text{for } \textit{j} = 1 \text{ to } \textit{n} \text{ do} \\ &\text{M}[\textit{i},\textit{j}] = \min \begin{cases} \alpha_{\textit{x}_i\textit{y}_j} + \textit{M}[\textit{i}-1,\textit{j}-1], \\ \delta + \textit{M}[\textit{i}-1,\textit{j}], \\ \delta + \textit{M}[\textit{i},\textit{j}-1] \end{cases} \end{aligned}$$

#### **Analysis**

- Running time is O(mn).
- Space used is O(mn).

Sariel (UIUC) CS473 31 Fall 2011 31 / 42

## Matrix and DAG of Computation

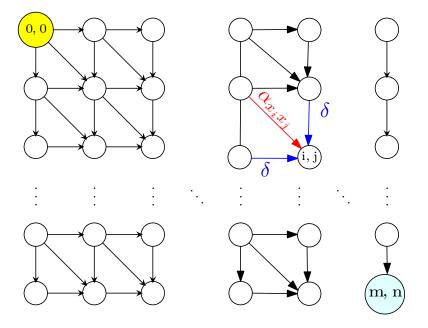

Figure: Iterative algorithm in previous slide computes values in row order. Optimal value is a shortest path from (0,0) to (m,n) in .

Sariel (UIUC) CS473 32 Fall 2011 32 / 42

# Sequence Alignment in Practice

- ullet Typically the DNA sequences that are aligned are about  $10^5$  letters long!
- ullet So about  $10^{10}$  operations and  $10^{10}$  bytes needed
- The killer is the 10GB storage
- Can we reduce space requirements?

Sariel (UIUC) CS473 33 Fall 2011 33 / 42

# **Optimizing Space**

Recall

$$egin{aligned} extbf{ extit{M}}( extbf{ extit{i}}, extbf{ extit{j}}) &= \min egin{cases} lpha_{ extit{ extit{x}}_i extbf{ extit{y}}_j} + extbf{ extit{M}}( extbf{ extit{i}}-1, extbf{ extit{j}}-1), \ \delta + extbf{ extit{M}}( extbf{ extit{i}}, extbf{ extit{j}}-1) \end{cases} \end{aligned}$$

- Entries in jth column only depend on (j-1)st column and earlier entries in jth column
- Only store the current column and the previous column reusing space; N(i, 0) stores M(i, j 1) and N(i, 1) stores M(i, j)

## Computing in column order to save space

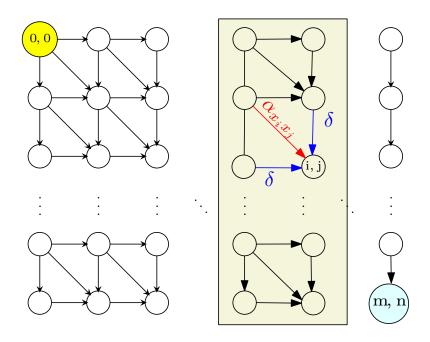

Figure: M(i, j) only depends on previous column values. Keep only two columns and compute in column order.

## Space Efficient Algorithm

for all 
$$i$$
 do  $N[i,0] = i\delta$   
for  $j=1$  to  $n$  do  
 $N[0,1] = j\delta$  (\* corresponds to  $M(0,j)$  \*)  
for  $i=1$  to  $m$  do  

$$N[i,1] = \min \begin{cases} \alpha_{x_iy_j} + N[i-1,0] \\ \delta + N[i-1,1] \\ \delta + N[i,0] \end{cases}$$
for  $i=1$  to  $m$  do  

$$\operatorname{Copy} N[i,0] = N[i,1]$$

## Analysis

Running time is O(mn) and space used is O(2m) = O(m)

# **Analyzing Space Efficiency**

- From the  $m \times n$  matrix M we can construct the actual alignment (exercise)
- Matrix N computes cost of optimal alignment but no way to construct the actual alignment
- Space efficient computation of alignment? More complicated algorithm — see text book.

Sariel (UIUC) CS473 37 Fall 2011 37 / 42

# Takeaway Points

- Dynamic programming is based on finding a recursive way to solve the problem. Need a recursion that generates a small number of subproblems.
- Given a recursive algorithm there is a natural DAG associated with the subproblems that are generated for given instance; this is the dependency graph. An iterative algorithm simply evaluates the subproblems in some topological sort of this DAG.
- The space required to evaluate the answer can be reduced in some cases by a careful examination of that dependency DAG of the subproblems and keeping only a subset of the DAG at any time.

Sariel (UIUC) CS473 38 Fall 2011 38 / 4
