Final: Tuesday, December 11, 14:00-15:15, 2018 DCL 1310

Name:	
NetID:	

- ***Don't panic!***
- If you brought anything except your writing implements, your double-sided **handwritten** (in the original) 8½" × 11" cheat sheet, and your university ID, please put it away for the duration of the exam. In particular, please turn off and put away *all* medically unnecessary electronic devices.
- **Best answer.** Choose best possible choice if multiple options seems correct to you – for algorithms, faster is always better.
- Please ask for clarification if any question is unclear.
- **This exam lasts 75 minutes.**
- Fill your answers in the Scantron form using a pencil. We also recommend you circle/mark your answer in the exam booklet.
- Do not fill more than one answer on the Scantron form - such answers would not be graded. Also, fill your answer once you are sure of your answer – erasing an answer might make the form unscannable.
- ***Good luck!***

Before doing the exam...

- Fill your name and netid in the back of the Scantron form, and also on the top of this page.
- **Fill in the pattern shown on the right in the Scantron form.**

  This encodes which version of the exam you are taking, so that we can grade it.

93 A ● C D E
94 ● B C D E
95 A B C D ●
96 A B C D ●

6

---

1. (2 points)
Given a directed graph with n vertices and m edges, and positive integer weights on the edges, deciding if there is a path between two vertices of weight exactly W is

(A) Can be solved in linear time.
(B) Can be solved in polynomial time.
(C) None of the other answers.
(D) NPC.
(E) Can be solved in the time it takes do Dijkstra in the graph.

---

2. (2 points)
Let A, B be two sequences of n bits each. Let $A + i$ be the sequence resulting from having a run of i zeroes, followed by the sequence A, and then followed by $n - i$ zeroes (i.e., the sequence $A + i$ is of length $2n$). For two sequence $X = x_1, \ldots, x_n$ and $Y = y_1, \ldots, y_n$, let $\langle X, Y \rangle = \sum_i x_i y_i$ be their dot-product. Computing i and j such that $\langle A + i, B + j \rangle$ ix maximal can be done in time (faster is better):

(A) $O(n \log n)$.
(B) $O(n^{3/2})$.
(C) $O(n)$.
(D) $O(n^2)$.
(E) $O(n^2 \log n)$.

---

3. (2 points)
Given a set X of n numbers, and an array T of size n^2. Let $\mathcal{H}$ be a 2-universal family of hash functions into T. A hash function h is good, if no two elements of X collide when mapped by h into T. We have that

(A) There is at least one good function in $\mathcal{H}$.
(B) All the functions in $\mathcal{H}$ are good.
(C) At least half the functions in $\mathcal{H}$ are good.
(D) When 2-universal family of functions sends its functions, they are not sending their best. They are bringing collisions. They are mixing values. They are bad. And some, I assume, are good functions.
(E) There is not necessarily any good function in $\mathcal{H}$ because of the birthday paradox.

4. (2 points)

Given a graph G with n vertices and m edges, computing a vertex cover in G, of size $2k$, if there is such a cover of size k, can be done in time (faster is better):

(A) $O(k^{m+n}(n+m))$
(B) $O(n^k(n+m))$
(C) $O(m)$
(D) $O(2^{2k}(n+m))$
(E) $O(n)$

---

5. (2 points)

Consider a weighted instance of set cover $(G, \mathcal{F})$ that is special – there are n elements in the ground set, and every element appears in at most t sets of $\mathcal{F}$, where t is some small integer positive constant. Here, each set in $\mathcal{F}$ has an associated positive cost, and the purpose is to find a minimum cost collection of sets that covers G. Here, you can assume that LP can be solved in polynomial time. Which of the following statements is correct (a better approximation is better):

(A) One can compute a $O(\log n)$ approximation in polynomial time.
(B) One can compute a t approximation in polynomial time.
(C) One can compute a $t/2$ approximation in polynomial time.
(D) One can compute a $O(\log t)$ approximation in polynomial time.

---

6. (2 points)

Consider an unweighted graph G with diameter $\Delta > 1$ (i.e., the shortest path between any pair of vertices of G is at most Δ, and there is a pair with this distance). There must be an independent set in G of size at least (bigger is better)

(A) Δ^2
(B) $\lfloor n/(1+\Delta) \rfloor$
(C) n/Δ^2
(D) $\lceil (\Delta+1)/2 \rceil$.
(E) Δ

7. (2 points)
Consider a random variable X_i, where $X_0 = n$, and $\mathbb{E}[X_i \mid X_{i-1}] = \lfloor X_{i-1}/2 \rfloor$, for all $i > 0$. Let U be the first index such that $X_U = 0$. Consider the probability that $\mathbb{P}[U \geq 4 \lceil \log_2 n \rceil]$. This probability is bounded by (the smaller the upper bound, the better):

(A) $1/2$.
(B) $1/n^3$.
(C) $1/n^{40}$.
(D) $1/n$.
(E) $1/n^2$.

---

8. (2 points)
Let G be an undirected graph with n vertices and m edges that can be colored using k colors. Then:

(A) One can color the graph using $O(k^2)$ colors in polynomial time.
(B) There is an independent set in G of size $\geq \lceil n/k \rceil$.
(C) There is an independent set in G of size $\geq k$.
(D) One can $O(k)$ approximate the largest independent set in G in polynomial time.

---

9. (2 points)
You are given two sets R, B of n points in $\mathbb{R}^d$, and consider the problem of computing a hyperplane that separates them (say, it passes through the origin). Let Δ be the diameter of $R \cup B$, and let $\ell = \min_{r \in R, b \in B} \|r - b\|$. Which of the following statements is correct.

(A) since the problem is equivalent to linear programming, and we do not know if there is a strongly polynomial time algorithm for LP, it follows that this can not be solved in polynomial time.
(B) running time $O(n^{\lfloor d/2 \rfloor})$ is possible, and no faster algorithm is possible.
(C) the problem is NP-Hard.
(D) running time $O(n^{d+1})$ is possible, and no faster algorithm is possible.
(E) one can compute such a separating hyperplane in time polynomial in Δ and $1/\ell$, d, and n.

---

10. (2 points)
Let G be an undirected graph with $n > 1$ vertices and $m > 1$ edges. Let M be a matching in G, such that any augmenting path for M has length at most $2k + 1$. Let opt be the maximum matching in G. We have that :

(A) $|M| \leq \big(1 - 1/(4k+1)\big)\,|\mathrm{opt}|$.
(B) $|M| \geq \big(1 - 1/(k+1)\big)\,|\mathrm{opt}|$.
(C) $|M| \geq \big(1 - 1/(4k+1)\big)\,|\mathrm{opt}|$.
(D) None of the other answers are correct.
(E) $|M| \leq \big(1 - 1/(k+1)\big)\,|\mathrm{opt}|$.

11. (2 points)
Deciding if a 3SAT formula F with n variables and m clauses is satisfiable can be done in time (faster is better):

(A) $O(2^n m)$
(B) None of the other answers.
(C) $O(2^{n-m})$
(D) $O((n+m)^2)$
(E) $O(n+m)$

---

12. (2 points)
Let G be an undirected unweighted graph with $n > 1$ vertices and $m > 1$ edges. A ***minimal cycle*** is a cycle in G such that no proper subset of its vertices form a cycle in G. How fast can one compute a minimal cycle?

(A) $O(n \log n + m)$.
(B) $O(nm)$.
(C) $O(nm^2)$.
(D) $O(n+m)$.
(E) $O((n+m)\log n)$.

---

13. (2 points)
Let G be an instance of network flow with all capacities being integer numbers. Then, the maximum flow must assign integral flow to all the edges of G. This statement is

(A) NPC.
(B) False.
(C) True.

---

14. (2 points)
Let X be a set of n distinct numbers in $[0,1]$. Let $x_1, \ldots, x_k$ be k numbers of X. Computing the rank of each of the x_i, for $i = 1, \ldots, k$, can be done in time (faster is better):

(A) $O(nk)$.
(B) $O(n \log k)$.
(C) $O(n \log n + k \log n)$.
(D) $O(k)$.
(E) $O(k \log n)$.

15. (2 points)

Let G be an integral instance of network flow, with n vertices and m edges. Let s be the source, and let K be the value of the maximum flow in G. Let τ be a parameter. Deciding if there is a maximum flow in G of value K that uses only τ edges coming out of s (i.e., all the other edges from s have zero flow on them) is

(A) NPC.

(B) Can be done in polynomial time using maximum flow.

---

16. (2 points)

Let G be a DAG over n vertices, and let H be the undirected version of G. Which is of the following statements is correct:

(A) There is always a (simple) path in H of length $\lfloor\sqrt{n}\rfloor$, or alternatively there is an independent set in H of size $n/2$.

(B) There is always a (simple) path in G of length $\lfloor\sqrt{n}\rfloor$, or alternatively there is an independent set in H of size $\lfloor\sqrt{n}\rfloor$.

---

17. (2 points)

You are given an undirected graph (with multiplicities on the edges) G with n vertices and m edges. Furthermore, assume you are given an oracle, such that given an input graph G, it returns you an edge that is not in some min-cut of G (this takes constant time), if such an edge exists. Given such an oracle, one can compute the min-cut in the graph in time (faster is better):

(A) $O(n^3)$.

(B) $O(n \log^2 n)$.

(C) $O(n^4)$.

(D) $O(m \log n)$.

(E) $O(n)$.

---

18. (2 points)

Given n random real numbers picked uniformly and independently from the interval $[0, 1]$, one can decide if there are two equal numbers, with high probability, in time (faster is better):

(A) $O(n \log \log n)$.

(B) $O(n)$.

(C) $O(n \log n)$.

(D) $O(1)$.

19. (2 points)

Given an unweighted undirected graph G, and parameters k and r, consider the problem of deciding if there is a set S of k vertices in G, such that all vertices in G are in distance at most r from some vertex of S. Which of the following statements is false.

(A) This problem is NPC even for $r = 1$.

(B) This problem can be solved in polynomial time for $r \geq n/10$.

(C) If there is such a set, then one can compute efficiently a set S' that has the same property, but with distance $2r$.

(D) This problem is NPC even if the graph is a tree.

---

20. (2 points)

You are given an algorithm alg for an NP problem X, which is a polynomial time certifier/verifier. Furthermore, assume that any positive instance of X has a certificate of length $O(\log n)$. Then, we have that

(A) X can be solved in polynomial time.

(B) None of the other answers.

(C) X is NPC.

(D) If X is NPC, then all the problems in NP have $O(\log n)$ certificate.

---

21. (2 points)

Let G be a graph with a min cut of size $k \geq 1$.

(A) The graph G does not necessarily has a spanning tree.

(B) The graph G has at least k edge disjoint spanning trees, and no stronger statement can be made.

(C) The graph G has at least one spanning tree, and no stronger statement can be made.

---

22. (2 points)

Consider an input $X \equiv x_1, \ldots, x_n$ of n numbers, and let k be a parameter (which is relatively small compared to n). Let Y be the sequence X after it is being sorted. Assume that every number in X is at most k locations away from its location in Y. The sorted list Y can be computed by a sorting network of depth (smaller is better):

(A) $O(n)$.

(B) $O(\log^2 n)$.

(C) $O(\log^2 k)$.

(D) $O(n \log n)$.

(E) $O(k)$.

23. (2 points)
Let L be an instance of linear programming with n variables and 7 constraints. Computing the value of the optimal solution for such an LP can be solved in

(A) This problem is NPC.
(B) $O(n^n)$ time using the simplex algorithm.
(C) Polynomial time.

---

24. (2 points)
Let G be an instance of network flow with all capacities being rational numbers. Then, the Ford-Fulkerson method would always stop and compute the maximum flow in G. This statement is

(A) True.
(B) False.

---

25. (2 points)
Consider the problem of deciding if a graph has a set X of k edges, such that each vertex is adjacent to an edge in X. This problem is:

(A) A variant of 2SAT, and it is solvable in linear time.
(B) A variant of 3SAT, and it is NPC.
(C) solvable in polynomial time.
(D) A variant of Vertex Cover, and it is NPC.

---

26. (2 points)
Consider the problem of given three strings s_1, s_2, s_3 of total length n, computing the longest string T that is contained in all three strings. Here T is contained in s_i, if one can delete characters in s_i to get T, for $i = 1, 2, 3$. This problem can be solved in (faster is better):

(A) $O(n^2)$.
(B) $O(n^3)$.
(C) $O(n^4)$.
(D) $O(n \log n)$.
(E) $O(n)$.

27. (2 points)

Let I be an instance of network flow, defined over a graph with n vertices and m edges. Let L be the LP modeling the network-flow. The LP L can be solved in time T. Up to constant factors, we have:

(A) T = Time it takes to solve network flow of this size.

(B) The time T is (asymptotically) more than it takes to solve network flow, but less than the time it takes solve a general LP with this number of variables and constraints.

(C) T = Time it takes to solve a general LP with this number of constraints and variables, and not faster.

---

28. (2 points)

You are given a stream S of n numbers, and space $s = \Omega(n^c)$, where $c \in (0, 1)$ is a constant, one can compute the median of S by reading the stream (smaller is better):

(A) $O(\sqrt{n})$ times.

(B) $O(n^c)$ times.

(C) $O(1/c)$ times.

(D) $O(\log^2 n)$ times.

(E) $O(n^{1/c})$ times.

---

29. (2 points)

Let P be a set of points in the plane, such that all pairwise distances are unique, and $n = |P|$. Let $p_1, \ldots, p_n$ be a random permutation of the points, and let $\Delta_i = \max_{b<c\leq i} \|p_b - p_c\|$ be the diameter of $p_1, \ldots, p_i$, for $i = 2, \ldots n$. Let $\alpha_i = \mathbb{P}[\Delta_i \neq \Delta_{i-1}]$. For $i > 2$, we have that

(A) $\alpha_i = 2/i$.

(B) $\alpha_i \leq 1 - 2/i$.

(C) $\alpha_i = 0$.

(D) $\alpha_i = 1/i$.

(E) $\alpha_i = 1 - 2/i$.

30. (2 points)

Consider a graph G with n vertices and m edges. Let k be some positive integer number. A k multi-way cut, is a partition of the vertices of G into k sets $(S_1, \ldots, S_k)$. An edge is in the cut, if its endpoints are in different sets of this partition.

(A) There is always a multi-way cut with at least $m/\sqrt{k}$ edges, and no stronger statement can be made

(B) There is always a multi-way cut with at least $m/2$ edges, and no stronger statement can be made

(C) There is always a multi-way cut with at least $\sqrt{m/k}$ edges, and no stronger statement can be made

(D) There is always a multi-way cut with at least $(1 - 1/k)m$ edges, and no stronger statement can be made.

(E) There is always a multi-way cut with at least m/k edges, and no stronger statement can be made

---

31. (2 points)

Let G be a directed graph with weights on the edges, which might be negative or positive. We have the following:

(A) Computing the longest simple cycle in G is NP-Hard.

(B) All the other answers are correct.

(C) Computing the shortest simple cycle in G is NP-Hard.

(D) Computing if there is a negative cycle in G can be done in polynomial time.

---

32. (2 points)

In the shortest-path with colors problem, you are given a weighted undirected graph G, a start vertex s, an end vertex t, and a list of k colors $c_1, \ldots, c_k$ that you need to pick. Every vertex has an associated color. A path $\pi = v_1, v_2, \ldots, v_t$ from s to t is ***valid*** if, for any i, $1 \leq i \leq k$, the color c_i appears in some location ℓ_i (i.e., the color of v_{ℓ_i} is c_i). Furthermore, $\ell_1 < \ell_2 < \cdots \ell_k$. The task is to compute the shortest path (not necessarily simple) of this type.

This problem is

(A) This version is NP-Hard, and the version where you just have to pick all the colors (but the order does not matter) is also NP-Hard.

(B) Solvable in $O(n^3)$ time, and no faster algorithm is possible.

(C) Solvable in $O(k(n \log n + m))$ time.

(D) Solvable in $O(n \log n + m)$ time, and no faster algorithm is possible.

(E) NP-Hard.

33. (2 points)

Let L be an instance of linear programming with n variables and 7 constraints. Computing the value of the optimal solution for such an LP can be solved in

(A) Polynomial time.

(B) $O(n^n)$ time using the simplex algorithm.

(C) This problem is NPC.

---

34. (2 points)

Consider a graph G over n vertices, with an ordering of the vertices $v_1, v_2, \ldots, v_n$, such that v_i has at most k edges to $\{v_1, \ldots, v_{i-1}\}$, for all i. We have that:

(A) All of the other answers are correct.

(B) G can be colored using $k+1$ colors.

(C) G has at most kn edges.

(D) G has an independent set of size $\geq n/(k+1)$

---

35. (2 points)

Consider a randomized algorithm that in the ith iteration, with probability $1/i^2$ has to perform $O(i^2)$ work, and otherwise it performs $O(\log i)$ work. The expected running time of this algorithm, over n iterations, is (smaller is better):

(A) $O(n^3)$.

(B) $O(n^2)$.

(C) $O(n \log^2 n)$.

(D) $O(n^4)$.

(E) $O(n \log n)$.

---

36. (2 points)

Let G be an undirected graph with $n > 4$ vertices and $m > 20n$ edges. Which of the following statements is correct:

(A) There is a matching in G of size $\Omega(m)$.

(B) There is a matching in G of size $\Omega(\sqrt{m})$.

(C) There is a matching in G of size $\geq 40\sqrt{m/n}$.

(D) There is a matching in G of size $\geq n/2$.

(E) There is a matching in G of size ≥ 10.

37. (2 points)

Let X be a set of n distinct numbers in $[0, 1]$. You are given an oracle that can, in $O(\log n)$ time, answer the following two queries:

(A) Given parameters $\alpha \leq \beta$, the oracle returns how many elements of X are in the interval $[\alpha, \beta]$.

(B) Given parameters $\alpha \leq \beta$, the oracle returns a random number in X that lies in the interval $[\alpha, \beta]$ (the random number is chosen uniformly among all such numbers).

Computing the median of X can be done in expected time (faster is better):

(A) $O(\log^3 n)$.

(B) $O(\log^2 n)$.

(C) $O(\log n)$.

(D) $O(1)$.

(E) $O(n)$.

---

38. (2 points)

Given two sets R and B of n points in $\mathbb{R}^3$, one can decide if R can be separated from B in expected time (faster is better):

(A) $O(n^3)$.

(B) $O(n)$.

(C) $O(n \log n)$.

(D) $O(n^n)$.

(E) None of other answers are correct.

---

39. (2 points)

Given a tree T with n vertices, computing the smallest dominating set (i.e., a set $X \subseteq \mathsf{V}(T)$, such that all the vertices in T are adjacent to a vertex of X [or are in X]) can be done in time:

(A) $O(n \log n)$.

(B) $O(n)$.

(C) $O(n^4)$.

(D) $O(n^3)$.

(E) $O(n^3)$.

40. (2 points)
Given an algorithm that can compute a maximum clique in a graph in polynomial time, would imply that

(A) All the problems that are NPC can be solved in polynomial time.
(B) None of the other answers.
(C) All the problems in NP can be solved in polynomial time.

---

41. (2 points)
Given a set X of n positive *real* numbers, there is always a hashing scheme that requites $O(1)$ time per operation, and can store X using $O(n)$ space. This statement is

(A) Incorrect.
(B) Mostly correct.
(C) correct.

---

42. (2 points)
Consider a weighted undirected graph G over n vertices, and let s be a vertex in G. Let $v_1, v_2, \ldots, v_n$ be a random permutation of the vertices. For any two vertices $x, y \in \mathsf{V}(\mathsf{G})$, let $d(x, y)$ denote the length of the shortest path in G between x and y. For $i = 1, \ldots, n$, let n_i be the closest vertex to s in G among the vertices of $V_i = \{v_1, \ldots, v_i\}$ (i.e., $n_i = \arg\min_{v \in V_i} d(s, v)$). Similarly, let $f_i = \arg\max_{v \in V_i} d(s, v)$ be the furthest neighbor in V_i, for all i. Let $\ell_i = \big(d(s, n_i) + d(s, f_i)\big)/2$.
Assume that all the pairwise distances in the graph are unique.

(A) All of the other answers are correct.
(B) The sequence $\ell_1, \ldots, \ell_n$ can have only 2 distinct values.
(C) The sequence $\ell_1, \ldots, \ell_n$ has $\Theta(\log n)$ distinct values with high probability.
(D) The sequence $\ell_1, \ldots, \ell_n$ has $\Theta(\log n)$ distinct values in expectation.
(E) The sequence $\ell_1, \ldots, \ell_n$ has $O(\log^2 n)$ distinct values in expectation.

---

43. (2 points)
Consider a given directed graph G with n vertices and m edges. A set of vertices S in G is influential, if for any vertex $v \in \mathsf{V}(\mathsf{G})$, there is a vertex $s \in S$, such that there is a path in G from s to v. One can compute in polynomial time (under the assumption that P $\neq$ NP) an α-approximation to the smallest influential set, where the value of α is (smaller is better):

(A) $O(n)$
(B) $O(\log \log n)$
(C) 2
(D) $O(\log n)$
(E) $O(\log^* n)$

44. (2 points)

There are known sorting networks that sort all binary strings correctly except for one string (yeh, wow). You are given a sorting network N, with n inputs and m gates, and parameters $\delta \in (0,1)$ and $\varepsilon \in (0,1)$. Verifying that N works correctly on a specific input can be done in $O(n+m)$ time. You want an algorithm that either finds an input for which N is wrong, or alternatively, the number of inputs for which N is wrong is at most $\delta 2^n$ (out of the 2^n possible binary inputs). An algorithm that makes such a decision, and is correct with probability at least $1-\varepsilon$, runs in (faster is better):

(A) $O((n+m)/(\delta\varepsilon))$.
(B) $O\big((n+m)\frac{1}{\delta}\log\frac{1}{\varepsilon}\big)$.
(C) $O(\log^2((n+m)/\delta\varepsilon))$.
(D) $O\big((n+m)\delta 2^m \log\frac{1}{\varepsilon}\big)$.
(E) $O((n+m)\delta 2^n/\varepsilon)$.

---

45. (2 points)

Consider k-CNF formula E over n variables, and with $n^{O(1)}$ clauses. Here, every clause has exactly k literals (which are all distinct variables). Consider the case that $k = 4$. We have that

(A) deciding if there is a satisfying assignment for E is NPC.
(B) E always has a satisfying assignment.

---

46. (2 points)

You are given an undirected graph G with n vertices and m edges. Assume that the min-cut in this graph is of size $k > 1$. Which of the following statements is correct.

(A) For any pair of vertices u, v in G, there are at least k edge disjoint paths that connect u to v.
(B) Any two vertices in G are on a simple cycle.
(C) The max-flow in G is of value k.

---

47. (2 points)

Let G be an instance of network flow, with n vertices and m edges. Computing acyclic maximum flow in G that has non-zero flow going through all the vertices in the graph (excluding the source and the sink) is

(A) NPC.
(B) Doable in polynomial time.

48. (2 points)

Let G be the complete graph with all the edges having weight either 1 or 2. Consider the problem of computing the cheapest simple cycle that goes through all the vertices of G. This problem can be

(A) solved exactly in $O(n^3)$ time using network flow.

(B) solved exactly in $O(n^2)$ time using matchings.

(C) solved exactly in polynomial time.

(D) 3/2-approximated, in polynomial time, and one can not do better.

(E) 2-approximated, in polynomial time, and one can not do better.

---

49. (2 points)

Let L be a maximization LP, and let L^* be its dual. Let x and x^* be two feasible solutions to L and L^*, respectively, and let u values of the LP L (i.e., the value of the target function being optimization for) for x. Similarly, let u^* be the value of L^* for x^*. We must have that

(A) If $u = +\infty$ then u^* is not necessarily defined.

(B) $u \leq u^*$.

(C) $u = u^*$.

---

50. (2 points)

Let X be some optimization problem (e.g., max clique). You are given a reduction improve that takes any polynomial time α-approximation algorithm to X, for any $\alpha > 1$, and generates a new polynomial time approximation algorithm, with the quality of approximation being improved to $O(\log \alpha)$. You are given a polynomial time $O(n)$-approximation algorithm to X. As such, we have the following:

(A) one can compute an $O(\log^* n)$-approximation to X in polynomial time.

(B) one can compute an $O(\log \log \log n)$-approximation to X in polynomial time.

(C) X is NP-Hard to approximate within any factor that is smaller than $\log n$.

(D) X is NP-Hard to approximate within a constant factor.

(E) one can compute an $O(1)$-approximation to X in polynomial time.
